Executive Summary

Idhna is a town of 30,000 inhabitants covering an area of 19.78 km² in the Hebron Governorate located 15 km southwest of Hebron City in the southern part of the West Bank. It is bordered by Tarqumiya to the north, Taffuh and Hebron to the east, Al Kum village to the south and the 1949 Armistice Line (the Green Line) to the west.

Idhna is located in the furthest west part of Palestine adjacent to the “Wall of Separation” that cuts several hundreds of hectares from Idhna’s land. Idhna is mainly an agricultural town (olives especially) and known in the region for scrap recycling. Idhna represents the “capital” of scrap recycling, and it is an important economic activity for it and surrounding towns.

While its livestock and dairy sectors are active, the city’s tourism suffers from the lack of touristic facilities as well as from negligence of the religious and archaeological sites.

The unemployment rate in the city has reached more than 25%, especially among graduates of universities and institutes, where only about 31% of the population are economically active. The scrap recycling activity, constituting the main pillar of the city’s economy still needs a lot of development to realize its full economic potential while mitigating the negative safety and environmental externalities.

Severe temperatures have scorched vegetation, and abrupt precipitation has caused flooding of urban and agricultural areas while also damaging underground structures.

The new municipality of Idhna has set, since its creation, a set of basic goals, the most important of which is the implementation of projects aimed at creating infrastructure, consolidating comprehensive development projects and supporting the city greening, in addition to supporting and participating in large-scale urban regeneration and expansion.

This document comprises the municipality’s Sustainable Energy Access and Climate Action Plan (SEACAP). It is a strategic planning document as well as a practical municipal operational tool. It defines the city’s climate action framework with quantifiable objectives to be reached by 2040 based on a Baseline Emissions Inventory (BEI) and an assessment of climate adaptation, mitigation, and sustainable energy needs.

The SEACAP was developed under the framework of the European Union’s Clima-Med project (Acting for Climate in South Mediterranean Cities). It complements and is in line with Palestine’s National Climate Strategies and Goals and with Idhna’s local development plans. The SEACAP was prepared with the full participation of the municipality’s leadership, its technical team, and in collaboration with the National Coordination Group led by the Ministry of Environment, the Clima-Med National Focal Point.

By preparing the SEACAP and by joining the CoM-Med, the municipality took an advanced step proving its willingness and dedication to face climate change, reduce its greenhouse gas (GHG) emissions, and build a model sustainable village with a clear vision, objectives, targets, and actions.

This SEACAP includes seven sections:

- Chapter 1: Municipality Description & Vision
- Chapter 2: Baseline Emissions Inventory
- Chapter 3: Risk & Vulnerability Assessment
- Chapter 4: Capacity Building & Local Governance
- Chapter 5: Mitigation Actions
- Chapter 6: Adaptation Actions
- Chapter 7: Communication

Chapter 1 introduces the municipality’s main goals of reducing air pollution, implementing mitigation actions and measures to reduce CO2 emissions as well as cope with the impacts of climate change affecting the area. The city wishes to use climate change action to create jobs, restore farms, sustain tourism, invest in renewables, and introduce eco-friendly water systems to head of looming health, employment, and other crises exacerbated by climate change.

Chapter 2 covers the Baseline Emission Inventory (BEI) quantifying current CO2 emissions and prioritizing mitigation measures. The BEI analysis calculates a one-time investment of EUR 28,152,100 will mitigate 17.7% of the emissions and save EUR 13,269,526 annually – otherwise, the city will reach around 253,210 tCO2-eq by 2040 if no measures are taken.

Figure 1: Emissions’ contribution in the BEI per consumption category

Thus, based on the BEI assessment, adequate mitigation actions (aiming to cut emissions) were selected. Next to this, adaptation actions (aiming at adapting to the irreversible effects of climate change) were identified. Both were further developed into SEACAP projects (chapters 5 and 6).

Chapter 3 assesses the city’s risk and vulnerability to the most impacted sectors from the climate hazards taking place in the region.

Chapter 4 focuses on capacity building and local governance, especially for actions related to sustainable energy, climate change adaption, and greening the city.

Chapter 5 and 6 detail mitigation actions by sector -- particularly the impact of a green building code – and quantifies adaptation actions. The table below summarizes the proposed measures and their emissions impacts, costs, and benefits by 2030 and 2040.

Chapter 7 provides an overall plan to motivate the municipality and its people with the information covered in chapters 1-6.

Table 1: Proposed mitigation measures and their emissions impacts, costs, and benefits by 2040

Sector	Action	Mitigation, MWh/a	Mitigation, tCO2-eq/a	Cost of implementation Euro	Annual Monetary Savings (Euro)	BAU emissions tCO2-eq at 2040	Climate cost efficiency 2040
Municipal Building	5.1.1 Municipal existing buildings: Consumption saving measures	291	87.2	N/A	43,057	977.8	N/A

Total contribution to emissions reduction 44,771/253,210= 17.68%		88,394.1	44,771.0	28,152,100	13,269,526	253,210	

1

Municipality Description & Vision

Chapter 1: Municipality Description & Vision

1.1 Municipal & NDC Targets

Under the unconditional target of Palestine's nationally determined contribution (NDC), and as part of the Covenant of Mayors Mediterranean (CoM-Med), Idhna is committed to reducing its emissions 17.5% by 2040 (with 2019 as the baseline). The city has set 10% as its intermediary target for 2030.

The overall target set by the local government emphasizes working closely with all community actors. It will take all necessary measures with its facilities to establish a good example for the community while collaborating with the public and achieving significant reductions from the residential, tertiary, and transportation sectors as well as from solid waste, water waste, and agriculture.

1.2 Overview of Municipality

1.2.1 Geographical Location

Idhna is a town in Hebron Governorate located 15 km southwest of Hebron city in the southern part of the West Bank. Idhna is bordered by Tarqumiya town to the north, Taffuh town and Hebron town to the east, Al Kum village to the south and the 1949 Armistice Line (the Green Line) to the west.

Idhna is located on low altitude hills ranging from 400m to 480m above sea level with mean annual rainfall between 410 and 440 mm, an average annual temperature of 19°C, and an average annual humidity of 60%; The rainy season is between November and April, winter can get rather cold and wet, and summer is hot and uncomfortable.

The total area of the town is about 19,780 dunams comprised of a built-up area of 3,050 dunams and an agricultural area of 11,500 dunams, and a confiscated area of 3,800 dunams.

1.2.2 Population & Employment

The population is about 30,000 – 51% male and 49% female. The town suffers from a large population congestion because of the occupation of more than 60% of its territory with the separation wall.

The 2007 census showed the young as the dominant group with 42.3% 14 years and younger, compared to only 54.4% of the population falling into the 15-64 age group, and 2.8% in the 65+ age group.

Regarding the job distribution, most of the population used to work in agriculture until their major portion of land was occupied in 1967. So, they had to shift their way of life to depend more on the jobs available either in town or inside Israel. Most workers in Israel do construction-related jobs and the rest are in agriculture. Most of the in-town jobs depend on the scrap sector that recently became major player in the region. The rest of jobs are

distributed among teaching (schools), construction, car maintenance-related services, and livestock. The unemployment rate is more than 25%, especially among graduates of universities and institutes. About 31% of the population are economically active (in the labour force), of whom 74.6% were employed and the remaining 25.4% either unemployed or have never worked.

1.2.3 Economic Sectors

Idhna lies on a total area of about 19,780 dunams of which 11,500 dunams are considered arable land. However, only 10,040 dunams are cultivated. There are some greenhouses producing several types of vegetables sold in the local market including fruity vegetables, leafy vegetables, and green legumes, bulbs, and other vegetables. Additionally, in the town of Idhna, there is a total area of 7,435 dunams planted with olive trees. Other trees planted in the area are mostly almond trees, fig trees, and grapevines.

Furthermore, residents depend on livestock rearing and dairy production. Statistics also show that 30% of the households are rearing and keeping domestic animals. In total, there are approximately 1,055 cows, 1,000 goats and 5,200 sheep in addition to 44 poultry farms with approximately 433,000 birds as well as 150 beehives belonging to Idhna residents. But, until today there is no designation of industrial area dedicated to host all such activities, so there's only livestock farms scattered among houses and buildings.

A key point to mention is that the scrap sector represents the major sector in Idhna among all towns around. Idhna is the "capital" of scrap recycling, though it is still primitive and needs a lot of development and reform to get all the workshops registered, certified, and taking the necessary precautions and safety measures.

Commercial establishments include 400 grocers, 30 clothing shops, 3 butchers, 6 blacksmiths, 6 carpenters, 20 private services shops, and 20 junk stores (scrap shops). In addition, there are many olive pressing, stone cutting, and soap factories.

Finally, although there are several ancient locations in the town and a number of mosques such as Othman Ben Afan Mosque, Abou Bakr Al Sediq Mosque as well as vestiges of Idhna's long history in the form of ruins such as the Nabi Saleh Ruins, the Beit Al Alam Ruins and others, tourism suffers from a lack of facilities as well as from the negligence of the religious and archaeological sites.

1.2.4 Infrastructure & Key Services

Idhna has been connected to an electrical network since 1994 supplied by the Israeli National Electrical Company (Qutria) and managed by the Palestinian Electricity Company. Approximately 95% of housing units are

connected to the network. The municipality's hope is to install a green electrical source (solar farm) to reduce full dependency on the Israeli Electrical Company.

The water network was originally provided in 1974 by Israeli Water Company Mecorot during the occupation of West Bank. Currently municipal officials estimate that 95% of housing units have access to the water network. Furthermore, people are relying on alternative water sources such as the two artesian wells existing in the town and some springs, but the water is becoming increasingly polluted. Another issue arises in the irrigation water. It is supplied from the water network as well as from the existing artesian wells and springs. This insufficient quantity of water available for agriculture forces farmers to buy water from private sources.

Solid waste is collected from the town through municipal garbage vehicles and health department staff. The municipality participates in the joint council for solid waste management in Hebron governorate where the waste is transferred to the joint council landfills. This waste collection process covers about 90% of the population.

However, management of wastewater is an issue in Idhna. The town is not connected to a sewage network. Therefore, wastewater is disposed of in septic tanks and cesspits. Municipal officials note that due to the obstacles to sanitary sewage disposal public health concerns are increasing as well as environmental and underground water pollution.

The road network is 80% paved, 50% of which are in need of rehabilitation.

1.3 Strategy

1.3.1 Vision for the Future

The vision for the municipality of Idhna stems from the municipality's history and intends to capitalise on the city's identity as a traditional city with sustainable tourism.

The challenges the municipality's long-term vision of sustainability is facing are issues related to sustainable growth and population increase.

The municipality's main goal is to reduce air pollution while implementing mitigation actions and measures reducing CO₂ emissions as well as cope with the impacts of climate change affecting the area.

The municipality's strategic decisions aim to use future development of the region to create local jobs for residents through reactivating the agricultural

sector as it was in the past, developing sustainable tourism, investing in producing renewable energy and energy efficiency equipment and materials, modern water harvesting systems, city greening, introducing a sustainable strategy for livestock development, plus a sustainable solid waste management strategy.

1.3.2 Complementarity & Coordination with Local & National Plans & Authorities

The SEACAP has been developed in line with the Palestinian National Climate Change Policy. The policy is designed to adapt the country to climate change impacts in water, coastal areas, agriculture/food security, health, tourism, biodiversity, and socioeconomic development/poverty.

In addition to the above, the SEACAP will play an essential role in supporting the implementation of Palestine's nationally determined contribution (NDC) submitted to the UNFCCC, which plans to unconditionally reduce greenhouse gas emissions 17.5% by 2040.

1.3.3 Adapting Administrative Structures & Involving Local Stakeholders

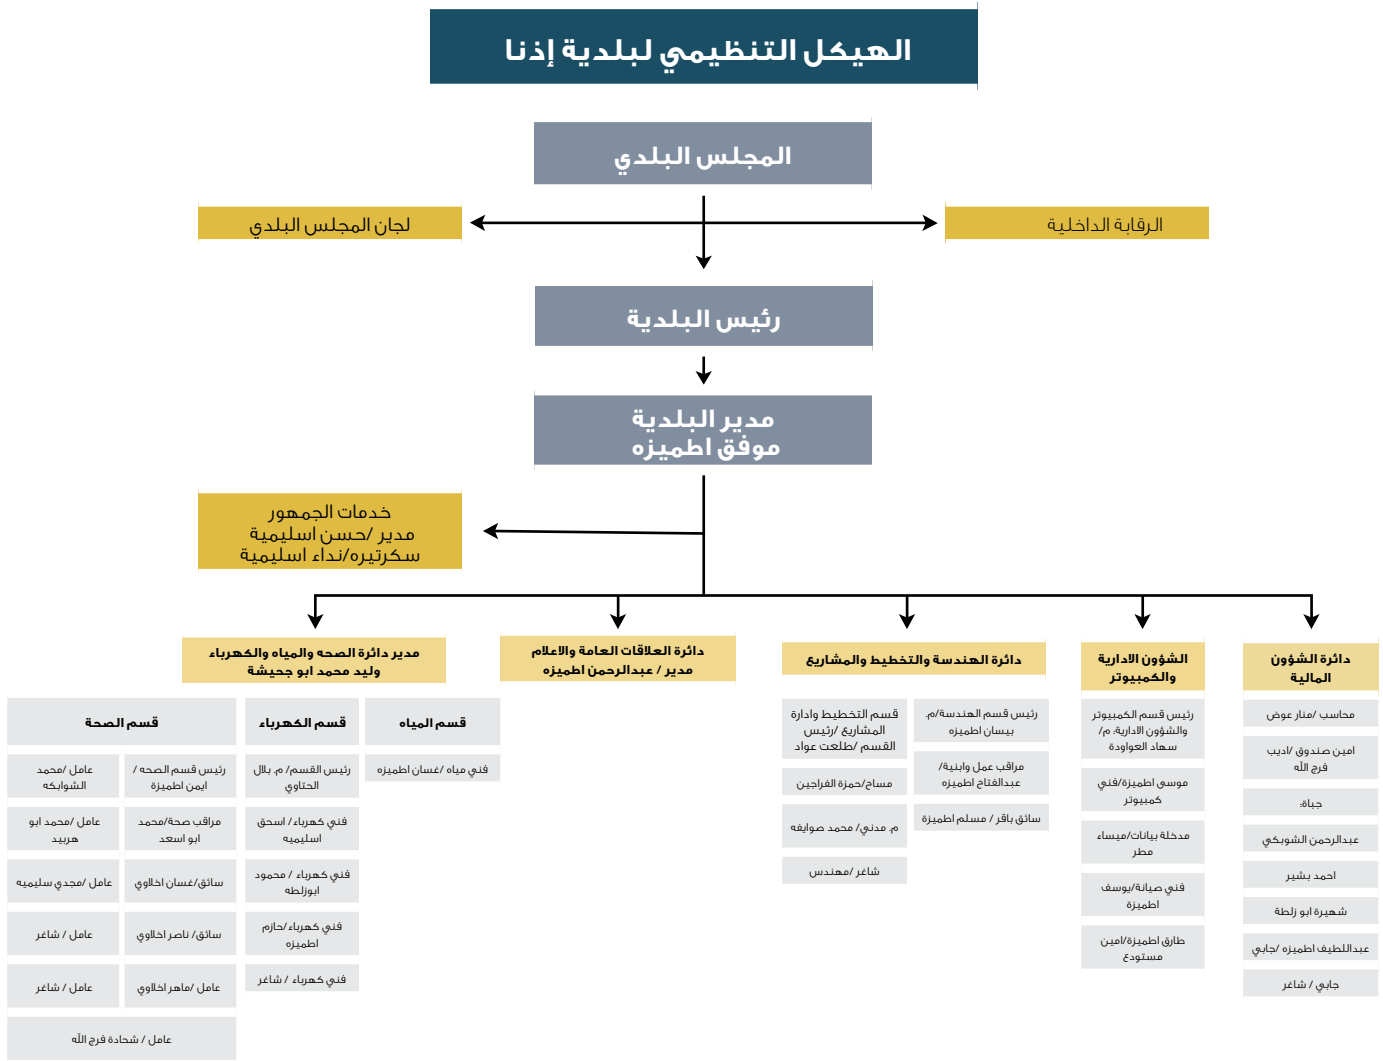

The plan will be mainstreamed through the current existing structures already set to implement similar initiatives. The municipality has an active technical services department and an environmental committee and the necessary channels to communicate with the local community and various significant local stakeholders.

To assure long-term sustainability, the relevant municipal staff, including members from the municipal council as well as volunteers from the local community, will engage in plan preparation and implementation beyond the current council mandate.

The municipality has appointed a local coordinator, responsible for overseeing the varied work between the different municipal departments, the mayor, and city council as well as with the local stakeholders engaged in the process. This role is especially challenging as authorities in different departments must cope with differing roles and responsibilities. SEACAP implementation usually requires a series of cross-sectoral targets, thus coordination between them and improvement of multi-level governance is of high importance.

Local stakeholders representing various sectors will be engaged in the process to discuss the actions envisaged for the area.

Figure 2: Idhna municipality's organigram

1.3.4 Overall Budget for Implementing & Financing Sources

The municipal funds largely originate from the budget received by the national government as well as municipal taxes (property, school, and licensing) and fees for services offered to citizens (e.g., solid waste removal). The municipal budget allows small-scale investments but is still heavily dependent on attracting grants or loans to implement planned activities.

1.3.5 Implementation & Monitoring Process

Implementing the Citizens Awareness Plan requires the participation of all municipal departments working in harmony to avoid conflicts. This requires the special SEACAP Unit working independently on the development of the frameworks and coordinating with each to monitor and evaluate the results.

The monitoring process tracks indicators allocated across all municipal activities to assess progress and take corrective actions as needed.

Baseline Emission Inventory (BEI)

Chapter 2: Baseline Emission Inventory (BEI)

2.1 BEI Methodology

The Baseline Emission Inventory (BEI) quantifies the amount of CO₂, or CO₂-equivalent emissions produced mainly due to energy consumption in the territory of the local authority during the selected baseline year. The BEI identifies the principal anthropogenic sources of CO₂ emissions and allows prioritizing the mitigation measures accordingly.

The emission inventory includes direct CO₂ emissions due to fuel combustion, indirect emissions related to consumption of grid-supplied energy (electricity, heat/cold), and relevant non-energy related emissions occurring in the territory of the local authority.

As the municipality has been using Intergovernmental Panel on Climate Change (IPCC) emission factors for CO₂-equivalents based on the IPCC 2006 Guidelines (IPCC 2006). The emissions of CH₄ and N₂O from the energy generating activities are already included in this methodological approach, for non-energy related activities like wastewater treatment, solid waste management, AFOLU, and others. The CH₄ and N₂O where applicable will be calculated separately and transformed into CO₂-eq. These emissions will be included in the BEI since the municipality is planning to include mitigation measures in these sectors.

Under the guidelines for the Maghreb and Mashreq countries, CO₂ emissions from the sustainable use of biomass/biofuels and emissions of certified green electricity are considered as zero in the calculation.

The method adopted in the BEI calculation utilizes the standard emission approach in line with the IPCC principles and complies with the UNFCCC reporting system.

2.1.1 Baseline Year

A primary component of the inventory process is choosing the baseline year. Determining the baseline year depends on the availability of accurate historical data. The baseline year is the year against which progress in emission reductions by 2040 will be compared. The municipality has selected 2019 as its baseline year.

2.1.2 BEI Sectors

The local authority will report CO₂ emissions for the following sectors:

- Municipal buildings, equipment, and facilities, including public lighting, tertiary buildings, and residential buildings
- Transportation, including the municipal fleet, private transport, and public transport
- Local energy production from renewable energy sources and other local power generation
- Other non-energy-related activities such as solid waste management, agriculture, and wastewater

2.1.3 Emission Factors & Conversion Rates

The emission factors expressed as tCO₂-eq/MWh are coefficients quantifying the emissions per category of activity data. The emission factors used by the local authority are the last updated emission factors provided by JRC and attributed to electricity consumption. The JRC-CoM-NEFE dataset includes the 1990-2015 time series of the National Emission Factors for Electricity Consumption (NEFE). Considering the lack of availability of more recent data, and following consultation with JRC, the emission factor for 2015 (IPCC approach) is used for calculations in this report. **The emissions factor is 0.720 tCO₂-eq per MWh.**

Besides electricity, the fuel emission factors used by the local authority, expressed in tCO₂-eq/MWh and presented in the table below, are the default factors of the IPCC (2006).

Table 2 : CO₂ Emissions Factor tCO₂-eq/MWh

Fuel	CO ₂ Emissions Factor tCO ₂ -eq/MWh
Diesel	0.268
Gasoline	0.250
Kerosene	0.259
LPG	0.227

The conversion factors between litres or kg and kWh expressed in kWh/L for fuel combustion used by the local authority are factors provided by the IPCC (2006) in the table below:

Table 3 : Conversion Factor for Energy Fuel Resources to kWh

Fuel	Conversion Factor	Unit
Diesel	9.2	kWh/L
Gasoline	10.0	kWh/L
Kerosene	9.7	kWh/L
LPG	13.7	KWh/Kg

2.2 Energy Consumption in Buildings

2.2.1 Municipal Buildings, Equipment & Facilities

The Municipality of Idhna has four buildings under its direct control and management – the main municipal building, post building, the community centre, and the project warehouse. Overall, the municipality is consuming 69.3 MWh per year, for lighting, space heating, cooling, and other electromechanical devices in the municipal buildings and facilities. The supplied electricity comes from the national electricity grid. Based on these assumptions, the table below presents the annual electrical consumption and emissions of municipal buildings, equipment, and facilities:

Table 4 : Municipal Buildings, Equipment & Facilities Annual Electrical Consumption and CO2 emissions

Site Category	Annual consumptions in MWh	Annual Emissions tCO2-eq
Municipal Building & Facilities	69.3	50

The fuel consumption figure provided for space heating regarding the municipal buildings is higher than expected, but no detailed information is given by the municipality to justify it.

Table 5 : Fuel consumption and CO2 emissions for municipal buildings' space heating

Fuel Type	Fuel consumptions in Litres	LPG (KG)	Fuel Consumptions in MWh	Annual Emissions in tCO2-eq
Diesel (Space Heating)	89000	0	890	238.5
LPG (Space Heating)	0	800	10.96	2.5
TOTAL			901	241

2.2.2 Residential Buildings

The municipality believes there are approximately 5,000 households in its area. Utility company data reflects annual electricity consumption of 22,000 MWh, resulting in an annual electricity consumption per capita of 733.33 kWh. Based on these assumptions, the table below presents the annual electricity consumption and emissions of residential buildings:

Table 6 : Residential Building Annual electricity consumption and CO2 emissions

Site Category	Annual consumptions in MWh	Annual Emissions in tCO2-eq
Residential Buildings	22,000	15,840

*Emission Factor for Electricity Consumption is 0.720 tCO2-eq/MWh (CoM-JRC)

The municipality's households consume LPG for space heating and cooking. The data provided by the municipality shows each household consumes about 18 kg of LPG per month for cooking and 30% of the households consume 18 kg per month for space heating during a four-month heating period. Based on these assumptions, the table below presents the annual fuel consumption and CO2 emission for cooking and space heating:

Table 7: Residential Annual Fuel Consumption and CO2 Emission For Cooking and Space Heating

Residential Buildings Annual Fuel Consumption and CO2 emissions			
Fuel Type	Fuel consumptions in Kg	Fuel Consumptions in MWh	Annual Emissions in tCO2-eq
LPG	1,188,000	16,275.60	3,694.56

2.2.3 Tertiary Buildings, Equipment & Facilities

The tertiary sector includes commercial buildings, private offices, banks, commercial and retail activities, private and government schools, hospitals, and other activities offering services beyond the control of the municipality. Based on the annual electricity consumption figures obtained from the utility company, the table below shows the annual energy consumption and emissions from tertiary buildings:

Table 8: Annual Energy Consumption and CO2 Emissions in Tertiary Buildings

Tertiary Buildings Annual Energy Consumption and CO2 emissions		
Site Category	Annual consumptions in MWh	Annual Emissions in tCO2-eq
Tertiary Buildings	830	597.6

*Emission Factor for Electricity Consumption is 0.720 tCO2-eq/MWh (CoM-JRC)

The annual fuel consumption for space heating and the relative CO2 emissions in tertiary buildings are shown in the table below:

Table 9: Residential Annual Fuel Consumption and CO2 Emission For Cooking and Space Heating

Fuel Type	Fuel consumptions in Kg	Fuel Consumptions in MWh	Annual Emissions in tCO2-eq
LPG	10300	141.1	32

*Emission factor for diesel is 0.268 in (tCO2-eq/MWh)

*Emission factor for LPG is 0.227 (tCO2-eq/MWh)

2.2.4 Buildings & facilities' Synopsis

Buildings consume a lot of electricity for lighting, heating, cooling, and other electrical device operations. The table below summarizes the annual electricity consumption and the CO2 emissions from buildings:

Table 10: Buildings & Facilities, a Summary of Annual Electricity Consumption and Emissions

Sector	FINAL ENERGY CONSUMPTION [MWh]				Total (MWh)	Emission tCO2-eq
	Electricity	Diesel	Fossil Fuels Gasoline	LPG		
BUILDINGS, EQUIPMENT/FACILITIES						
Municipal Buildings	69.3	890		10.96	970.26	291
Residential Buildings	22,000			16,275.60	38,275.60	19,534.56
Tertiary Buildings	830			141.10	971.10	629.6
Subtotal	22,900	890		16,427.6	40,216.96	20,455.16

2.3 Municipal Public Lighting

The municipality's street lighting is partly provided by LED efficient lights, but still heavily reliant on inefficient lamps (HPS, MH) causing high emissions of CO2. The annual electricity consumption and CO2 emissions for the baseline year are shown in the table below:

Table 11: Public Lighting Annual Electricity Consumption (MWh) and CO2 Emissions (tCO2-eq)

Type of street lamps	Quantities	Watt per lamp	Annual consumptions in MWh	Annual Emissions in tCO2-eq
HPS	250	150	165	118.8
MH	950	125	522.5	376.2
HPS	430	70	132.4	95.3
LED	170	100	74.8	53.8
TOTAL			894.74	644.2

*Emission Factor for Electricity Consumption is 0.720 tCO2-eq/MWh (CoM-JRC)

2.4 Transportation

The transportation sector in the city includes only road transport with subcategories such as the municipal fleet as well as private and commercial transport though there are no public transport services in the city. According to the municipality, the municipal fleet is comprised of 7 vehicles and includes passenger vehicles, light trucks, medium to large trucks, construction machinery, and other vehicles. The fuels used for the municipal fleet are gasoline and diesel.

Regarding private cars, their fuel consumption is calculated by the municipality based on the total numbers of cars in the region, the average distance travelled, and the average consumption per kilometre for each type of vehicle. The same approach is used for the commercial vehicles. Based on the numbers provided by the municipality, the table below presents the estimated data for annual diesel and gasoline consumption:

Table 12: Municipal, Public & Private Transport Fuel Consumption and CO2 Emissions

Fuel Type	Municipal Fleet	Private Transport	Public Transport	Fuel consumptions in Litres	Fuel Consumptions in MWh	Annual Emissions in tCO2-eq
Diesel	55,600	15,562,500	0	15,618,100	156,181	41,856.5
Gasoline	0	3,170,000	0	3,170,000	29,164	7,291
TOTAL				18,788,100	185,345	49,147.5

*Emission factor for diesel 0.268 in (tCO2-eq/MWh)

*Emission factor for Gasoline 0.25 in (tCO2-eq/MWh)

*Conversion factor for diesel 0.010 in (MWh/L)

*Conversion factor for Gasoline 0.0092 in (MWh/L)

2.4.1 Transport for Solid Waste Management

The municipality collects and transfers solid waste using different types of garbage vehicles which consumes significant diesel. With a population of 30,000, the solid waste produced is about 7,300 tons annually, 20 tons daily, and is steadily increasing due to increasing population. Solid waste produced is 46% organic waste and 54% other materials. The table below shows the annual fuel consumption for the garbage vehicles. It is noted that the SWM consumptions have not been included in the public and private consumptions in Table 12.

Table 13: Annual Fuel Consumption For The Garbage Vehicles

Annual Solid Waste Garbage Vehicles Fuel Consumption and CO2 Emissions			
Municipality	Diesel/a	Consumption in MWh	tCO2-eq
Idhna	18,600	186	49.85

Table 14: Total Emissions On Transportation In The City

Sector	Fuel Consumptions (MWh)	Emission tCO2-eq
Municipal Fleet	556	149
SWM Fleet	186	49.85
Private cars/trucks	184,789	48,998.50
Total	185,531	49,197.35

2.5 SWM landfill emissions

Idhna's waste is transferred to the Al Minya landfill.

The municipality's 30,000 people are producing around 20 tons of solid waste daily – 46% organic waste and 54% other materials.

Converting organic waste to compost represent one of the solutions for 46% of waste in Idhna. Composting is the process of controlled biological maturity under aerobic conditions, where the organic matter is decomposed into materials with shorter molecular chains more stable, hygienic, and finally beneficial for the agricultural crops and for recycling of soil organic matter.

The agricultural area cultivated in the city is about 10,000 dunams, most of it are olive trees, in addition to fruit, vegetables, grapevines, and mostly almond and fig trees. Hence it is crucial to support the farmers through producing organic fertilizers from organic waste to be used by farmers instead of synthetic fertilizers.

The scrap sector is important in Idhna and neighbouring towns. Idhna represents the "capital" of scrap recycling in primitive ways though still needing a lot of development and reform to get workshops facilitated, registered, certified, and take the necessary precautions and safety measures.

At the solid waste disposal sites (SWDS), the degradable organic carbon in waste is decomposed by bacteria under anaerobic conditions into methane (CH₄) and other compounds. The CH₄ emissions from SWDS are important contributors to global anthropogenic CH₄ emissions.

This report uses the IPCC default method of a simple mass balance calculation which estimates the amount of CH₄ emitted from the SWDS assuming that all CH₄ is released the same year in which the waste is disposed. The equation below calculates the landfill emissions and can also estimate emission reductions. This method is simple and emission calculations require only input of a limited set of parameters for which the IPCC Guidelines provide default values, where country-specific quantities and data are not available:

$$\text{Methane emissions (Gg/yr)} = (\text{MSWT} \times \text{MSWF} \times \text{MCF} \times \text{DOC} \times \text{DOCF} \times F \times 16/12 - R) \times (1 - \text{OX})$$

Where:

MSWT: total MSW generated (Gg/yr)

MSWF: fraction of MSW disposed to solid waste disposal sites (assumption 80%)

MCF: methane correction factor (fraction), 0.6 as general default value.

DOC: degradable organic carbon (fraction) (kg C/ kg SW)

$$\text{DOC} = (0.4 \times A) + (0.17 \times B) + (0.15 \times C) + (0.3 \times D)$$

Where:

A = Fraction of MSW, that is paper and textiles

B = Fraction of MSW that is garden waste, park waste or other non-food organic putrescibles

C = Fraction of MSW that is food waste

D = Fraction of MSW that is wood or straw

The table below analysis all West Bank landfills in 2017-2018 and Gaza in 2012 (1)

	Al Minya LF 2017	Zahrat Al Finjan LF 2017	Jericho LF 2018	Gaza Strip 2012
Organic	46.0%	55%	45.9%	56.6%
Plastic	18.3%	12%	26.4%	13.9%
Paper/ Cardboard	10.9%	14%	11.1%	7.6%
Glass	2.3%	1.5%	1.3%	1.96%
Metal	1.8%	2%	4.9%	2.27%
Others	20.7%	15.5%	10.6%	17.67%

(1) All data for WB provided by JSC Jericho on 19.3.2019 and by JSC Gaza for GS information. through "SOLID WASTE MANAGEMENT IN THE OCCUPIED PALESTINIAN TERRITORY West Bank including East Jerusalem & Gaza Strip" by Valérie Thöni & Samir K.I. Matar -September 2019

$$\text{DOC} = (0.4 \times 0.109) + (0.17 \times 0) + (0.15 \times 0.46) + (0.3 \times 0)$$

$$\text{DOC} = 0.1126$$

DOC_F: fraction DOC dissimilated; The IPCC default value is 0.77.

F: fraction of CH₄ in landfill gas (IPCC default is 0.5)

16/12: conversion of C to CH₄

R: recovered CH₄ (Gg/yr) The default value for methane recovery is zero.

OX: oxidation factor (fraction – IPCC default is 0)

The results:

Methane emissions (Gg/yr) = (7.3 Gg x 0.8 x 0.6 x 0.1126 x 0.77 x 0.5 x 16/12-0) x (1-0)

Methane emissions (Gg/yr) = 0.202535872 Gg/yr

Emission of methane in Gg/yr	Emission of methane t CO ₂ eq /yr	BAU year 2040 t CO ₂ eq /yr
0.202535872	0.202535872*1000*25= 5,063.4	5,063.4*3.36= 17,013.0

2.6 Renewable Energy Production &/or Green Energy

Renewable energy generation within the municipality is mainly solar and comes through PV electricity generation and solar water heaters as presented in the table below:

Table 15: Annual Solar Energy Produced and CO₂ Emissions Saving in 2019

Site category	SWH units	Unit area m ²	Annual Sunny Days	Average Solar irradiation in KWh/m ² /day	Annual MWh produced	Annual CO ₂ emissions
Solar water heater	4,000	2	300	5.3	12,720	0

2.7 Final Emissions from Fossil Fuels & Non-related Energy Activities

The total energy consumption in the territory of the local authority is the sum of electricity consumption and fuel consumption:

Table 16: Final emissions related to use of fossil fuels and non-related energy activities in the city as to base year 2019

Municipality final energy and non-energy activities		
Sector	MWh	tCO ₂ -eq
Buildings, equipment/facilities	40,217.0	20,455.2
Municipality	970.3	291.0
Residential	38,275.6	19,534.6
Tertiary	971.1	629.6
Public Lighting	894.7	644.2
Transport sector	185,531.0	49,197.3
Municipal Fleet	556.0	149.0
Private cars and trucks	184,789	48,998.5
SWM Fleet	186.0	49.8
SWM Land fill emissions		5,063.0
Renewable energy production- Green Energy	12,720	
TOTAL	239,362.7	75,359.7

An overview of the emissions' breakdown by sector is presented in the figures below.

Figure 3: Breakdown of emissions by sector

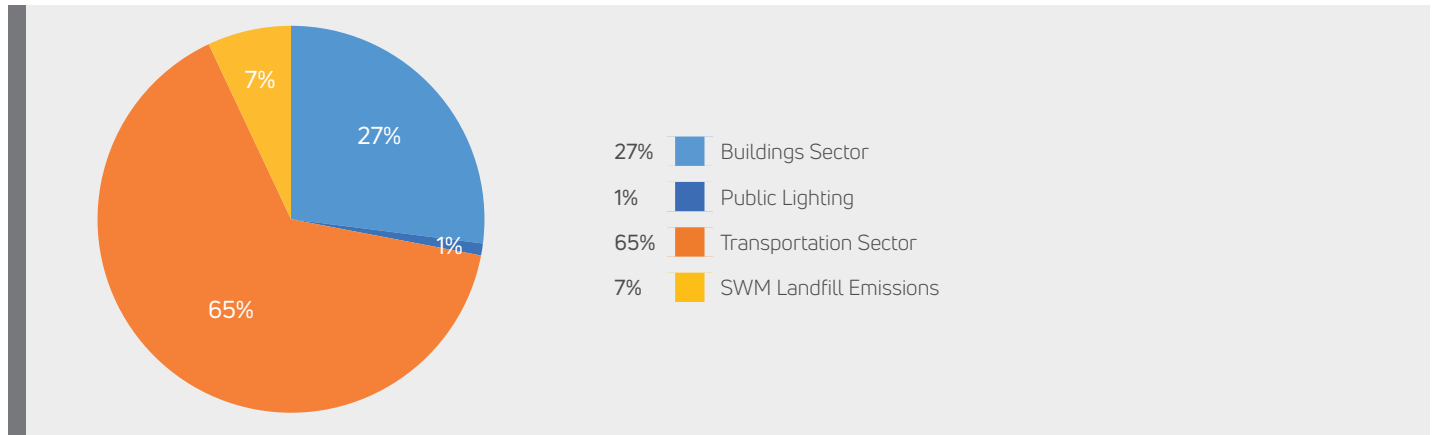

Figure 4: Breakdown of building sector's emissions by building type

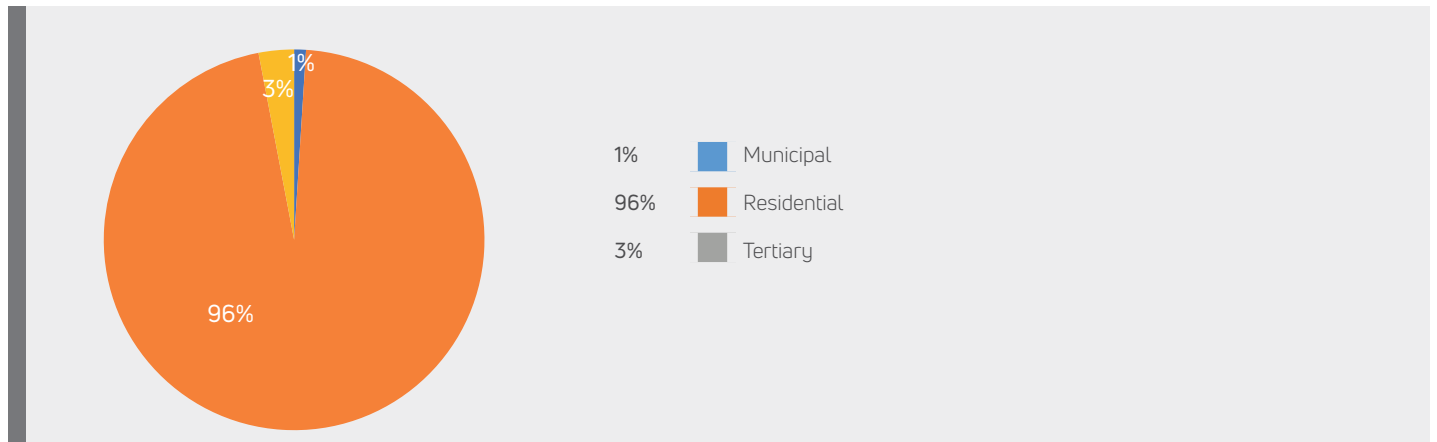

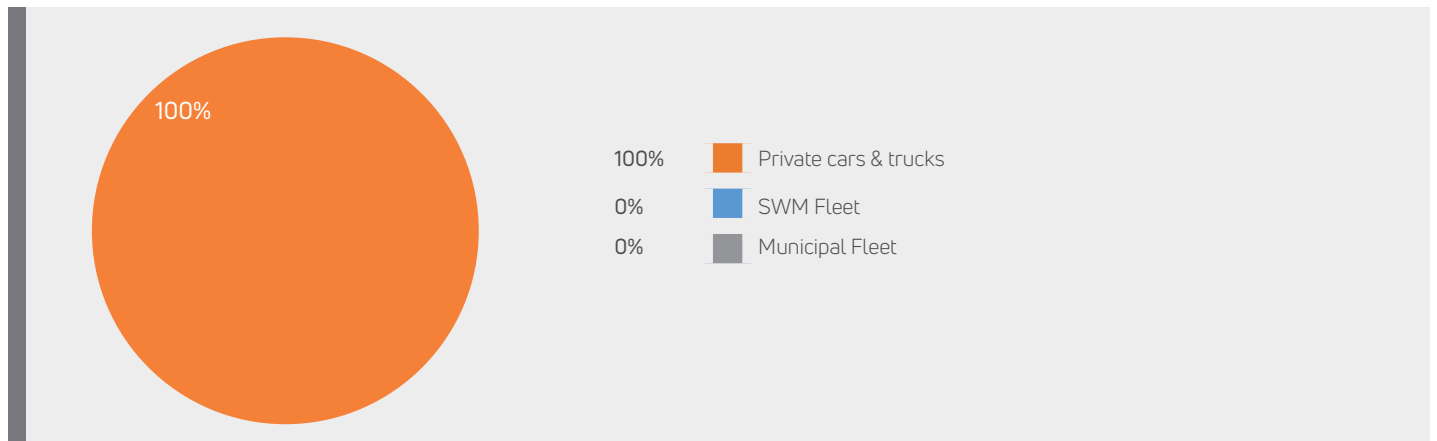

Figure 5: Breakdown of transport emissions by vehicle type.

2.8 BAU Scenario & 2040 Targets

The table below illustrates the municipality's projected emissions by 2040:

Table 17: Emissions CO₂-eq as BAU Scenario and Target for 2040

Municipality final energy and non-energy activities			
Sector	MWh	tCO ₂ -eq	BAU at 2040
Buildings, equipment/facilities	40,217.0	20,455.2	68,729.4
Municipality	970.3	291.0	977.8
Residential	38,275.6	19,534.6	65,636.1
Tertiary	971.1	629.6	2,115.5
Public Lighting	894.7	644.2	2,164.5
Transport sector	185,531.0	49,197.3	165,303.1
Municipal Fleet	556.0	149.0	500.6
Private cars and trucks	184,789.0	48,998.5	164,635.0
SWM Fleet	186.0	49.8	167.5
SWM Land fill emissions		5,063.4	17,013.0
Renewable energy production- Green Energy	12,720.0	0	0
TOTAL	239,362.7	75,359.7	253,210.0

*Annual Consumption x BAU Coefficient (3.36 in 2019 / JRC)

3

Risk &
Vulnerability
Assessment

Chapter 3: Risk and Vulnerability Assessment

3.1 Introduction on climate change impact

The Mediterranean region is rich in a large variety of complex climatic phenomena caused by its morphology and its geographical location. The location of the Mediterranean Sea in a transitional band between subtropical and midlatitude regimes produces large climate variability at multiple timescales and a strong seasonal variability of precipitation in many areas (Lionello 2012). The Mediterranean has been identified as one of the most prominent "Hot-Spots" in future climate change projections (Giorgi 2006). The water cycle and its extremes are one of the major concerns as many countries are over exploiting the water resources – a problem expected to deteriorate in the future. Episodes of extreme precipitation are also taking place and disastrous floods are a major threat for the region and especially the coastal areas. Additionally, phenomena taking place especially in the Southern Mediterranean countries (such as cultivation of marginal land, overgrazing, and firewood harvesting) put more pressure on the environment (Lionello 2012).

The Mediterranean region has experienced drastic changes in its climate over the years and has shown large climate shifts in the past (Luterbacher, et al. 2006). Twenty thousand years ago, cold steppes (with sparse forests) extended from the south of Spain to the Caucasus. In the northern part of the Mediterranean basin, the temperature of the coldest month was 15°C lower than it is today (Peyron, et al. 1998). Less water was available for vegetation. Over the last 2,000 years, the climate over the Mediterranean has experienced a sequence of humid/dry and warm/cold periods impacting environmental conditions.

According to a 2008 EIB report, for the Mediterranean region, climate experts anticipate during this century:

- An increase in air temperature in the range of 2.2°C to 5.1°C for the countries of Southern Europe and the Mediterranean region over the period 2080-2099 (compared with 1980-1999);
- A significant decrease in rainfall, ranging between -4 and -27% for the countries of Southern Europe and the Mediterranean region (while the countries of Northern Europe will report a rise between 0 and 16%);
- An increase in drought periods manifested by a high frequency of days during which the temperature would exceed 30°C. Extreme events (such as heat waves, droughts, or floods) are likely to be more frequent and violent; and
- An increase of the sea level which, according to some specific studies, could be around 35 cm by the end of the century..

Giannakopoulos et al. (2005) underlines that in line with the results of the projection scenarios, the most significant temperature increases this century are

expected in Eastern Egypt and especially the Nile Delta, Lebanon, Israel, Palestine, and the Maghreb. It is therefore evident that the more vulnerable Mediterranean areas will be those of North Africa adjacent to desert areas, the major deltas (such as the Nile Delta), the coastal areas (northern rim and southern rim of the Mediterranean basin), as well as the high-demographic growth and socially vulnerable areas (southern and eastern rim, densely populated cities and suburbs).

In the Mediterranean region, 50% of the urban population lives at an altitude of less than 10 meters above sea level – areas vulnerable to sea level rise. Additionally, tourist destinations in these areas are vulnerable not only due to the sea level rise, but also due to the temperature increase encountered (Plan Bleu 2009).

The impacts of climate change on the Mediterranean environment will relate particularly to (EIB, 2008):

- Water, via a change of its cycle due to a rise in evaporation and a decrease in rainfall. This water problem will be of crucial importance regarding sustainable development in the region;
- Soil, via the acceleration of already existing desertification phenomena;
- Land and marine biological diversity (animal and plant), via a displacement northward and in the altitude of certain species, extinction of less mobile or more climate sensitive species, and emergence of new species; and
- Forests, via a rise in fire hazards and parasite risks.

These impacts will exacerbate already existing pressures on the natural environment connected with anthropogenic activities, such as agriculture and fishery (reduction of yields), tourism attractiveness (heat waves, water scarcity), coastal areas and infrastructures (significant exposure to the action of waves, coastal storms and other extreme weather events, sea level rise), human health (heat waves), and the energy sector (water needs for power plants, hydropower, and increased consumption).

This all indicates southern and eastern Mediterranean countries appear to be more vulnerable to climate change than the northern Mediterranean countries.

Indeed, they are, on the one hand, more exposed to accelerated desertification, soil aridity and water scarcity and, on the other hand, presenting economic structures that are more strongly dependent on natural resources as well as relying on technical and financial capacities too limited to implement large-scale adaptation options (EIB 2008).

The Mediterranean, especially the Maghreb and Mashreq countries, is and will be more affected by climate change than most other regions of the world during the 21st century. The impacts from the rise in temperatures, the decrease in rainfall, the multiplication

of the number and intensity of extreme events and the possible rise in sea level overlap and amplify the already existing pressures of anthropogenic origin on the natural environment.

Through the crucial issue of scarcity of water resources, their impacts are fraught with consequences in the 21st century for human activities, in particular agriculture, fishery, tourism, infrastructure, urbanised coastal areas, and hydropower production. To minimize as much as possible the economic losses and damages, several adaptation options must be thought out and implemented.

Energy lies at the heart of the climate change issue. On one hand, it is the main GHG emitting sector, and CO2 emissions in the future are likely to increase much more rapidly than the global average. On the other hand, hydropower production—relatively significant in certain countries (13% of power production in the Maghreb and Mashreq countries)—is affected by the climate as well as by the plant cooling constraints. Lastly, the energy demand (in particular, electricity) which is growing at a very high pace in the region, is likely to be further accelerated by the additional demand necessary to lessen the impacts of climate change (water desalination, air-conditioning of buildings, etc.).

3.2 National & Regional Strategy on Climate Change Adaptation

3.2.1 National Level Commitments

The State of Palestine has gained accession to the United Nations Framework Convention on Climate Change (UNFCCC). On the 17th of March 2016, and, on the 22nd of April 2016, the Paris Agreement was signed and ratified entering into force on the 4th of November 2016. While Palestine's priority on climate change is adaptation, it is also committed to ensuring its emissions pathway is in line with the objective of the UNFCCC to stabilise greenhouse gas emissions at a level preventing dangerous anthropogenic interference with the climate system.

Palestine presents its NDC of development challenges as an adaptation priority for improving the living conditions of the Palestinian people as described in the NDC. Palestine's NDC also includes several important improvements in the state's energy security with reduced dependence on imported electricity from Israel and increased energy reserves through developing the Gaza Strip's gas field, in addition to improvements in people's living, health conditions, environment, improved waste management, increased food production, and increasing water resources.

3.2.2 Palestine's NDC Summary

According to the updated NDC submission in October 2021, Palestine intends to reduce its CO2-eq emissions with two different scenarios:

- Independence scenario – By ending the Israeli occupation, the Government of the State of Palestine achieves independence and is able to exercise full control over its resources which it intends to reduce emissions 26.6% by 2040 relative to the business-as-usual projections.
- Status quo scenario – Under a continued Israeli occupation of the State of Palestine (by no means an acceptable situation), Palestine still intends to reduce emissions 17.5% by 2040 relative to the business-as-usual projections.

3.2.3 Climate Data & Climate Projections

The Palestinian Territories refers to the West Bank (bordering Israel and Jordan) and Gaza Strip (bordering Israel and Egypt). Temperature in Palestine varies as the West Bank is a Mediterranean climate, whereas Gaza has a hot semi-arid climate with mild winters and dry hot summers.

Idhna town is located on the western edge of Palestine in the Hebron Governorate. Recently, Idhna's temperature has increased as well as droughts leaving a serious impact on agriculture. Additionally, the town has suffered from flooding nearly every year with waters reaching heights of 30-40 cm as a result of the absence of a water drainage network. Farms, transport, and homes are all regularly damaged.

3.3 Climate Change Risk Assessment & Vulnerability Analysis

The main climate hazards the municipality faces are extreme heat, extreme precipitation, and droughts. As mentioned above, the municipality is already dealing with these issues, which are expected to be aggravated in the short-term. These climate hazards affect a number of sectors, such as public health, infrastructure (transport, building, water), as well as the local economy, especially as concerns agriculture. The vulnerability analysis conducted is presented in the table below:

Table 18: Vulnerability Analysis

Receptors		Extreme Weather Event	Potential Impacts	Who/What Impacted	
Population	Public Health	Extreme heat	Deaths due to cardiovascular diseases	Everyone, but especially elderly people, babies, children, workers in outdoor environments, and sensitive groups of people	
			Spread of vector born and infectious diseases		
			Altered allergic pattern		
			Heat stress		
		Extreme precipitation	Altered water quality from pollutant runoff and heavy metals to lakes and streams	All people living in the area	
			Spread of waterborne disease		
Loss of lives					
Droughts	Asthma and cardiovascular diseases	All people living or working in the area			
	Accumulation of trace elements				
Infrastructure	Transport	Extreme heat	Road network damages	Roads, people mobility	
			Change in behaviour patterns		
			Air quality problems		
			Higher maintenance costs		
	Extreme precipitation	Increase risk of landslides; road network damage	Roads, public transport		
		Prospect of flooding increases; destruction of buildings			
	Energy	Extreme heat	Extreme heat	Altered electricity peaks/demands	Electricity providers and consumers
				Cooling problems	
				Reduced efficiency yield from distribution grid	
				Higher maintenance costs	
		Droughts	Droughts	Energy supply and demand pattern shift	Renewable energy facilities (PVs, etc.)
				Lower/no production from hydro power plants	
Higher maintenance costs					
Cooling problems					

Table 18: Vulnerability Analysis / continued

Receptors		Extreme Weather Event	Potential Impacts	Who/What Impacted
Infrastructure	Water	Extreme precipitation	Altered water quality due to runoff of pollutants and heavy metals to lakes and streams	Public health, water infrastructure
		Extreme heat	Higher water demand	
			Water quality issues	
			Higher maintenance costs	
		Droughts	Water scarcity	
			Water quality issues	
	Higher maintenance costs			
	Social	Extreme heat	Higher electricity demand to cover cooling needs	Hospitals, schools, public places, municipal facilities/ infrastructure, athletic facilities
			Changes in behaviour patterns (e.g., living outdoors)	
Burdening healthcare facilities due to increased patients in hospitals				
Droughts	Difficulties in meeting water demand for athletic facilities (e.g., swimming pools) and green public spaces	Hospitals, schools, public places, municipal facilities/ infrastructure, athletic facilities		
Built Environment	Building Stock & Material	Extreme heat	Concrete damages	All building infrastructure
			Increased cooling demands	
			Higher maintenance costs	
			Urban heat island effect	
		Droughts	Higher water demand	All building infrastructure
Economy	Tourist	Extreme heat	Increased demand for cooling	Tourists, tourist infrastructure, tourist related economy
			Lower tourist flows during impacted seasons	
			Higher water demand	
		Droughts	Increased pressure on water resources, escalating water scarcity issues	Tourists, tourist infrastructure
			Increased water supply costs	
		Floods	Damage to sites	
	Agriculture	Extreme heat	Changes in growth cycle	Farmers, food industry, consumers
			Damaged/loss of harvest	
Livestock loss and impacts on health				
Lower crop yields				

Table 18: Vulnerability Analysis

Receptors		Extreme Weather Event	Potential Impacts	Who/What Impacted
Economy	Agriculture	Droughts	Damaged/loss of harvest	Farmers, food industry, consumers
			Lower crop yields	
			Livestock loss and impacts on health	
			Land degradation	
			Dependence on other water sources for irrigation	
			Decrease in crops yield	
Biodiversity	Green Zones & Forests	Extreme heat	Fires and destruction of the ecosystem, flora, and fauna	Ecosystem, fish industry, consumers
		Droughts	Fires and destruction of the ecosystem, flora and fauna	Ecosystem

In the table below, the municipality's risk assessment outlines the impact of each climate hazard on the sectors identified above:

Table 19: Risk Assessment

Receptors		Weather Sensitivity	Future Risk	Impact
Population	Public Health	Extreme heat	- Increased number of deaths	Medium
			- Reinforcement of heat stress	
			- Increased infectious diseases	
			- Altered allergic patterns	
		Extreme precipitation	-Increased infectious diseases	Medium
			-Increased deaths	
Droughts	- Increased allergic incidents	High		
	- Decreased air quality			
	- More respiratory problems			
Infrastructure	Transport	Extreme heat	- Damages on road and rail network	Medium
			- Modification of transport frequency and means	
			- Air quality problems	
			- Higher maintenance costs	
	Extreme precipitation	-Damage of roads	Medium	
		- Increases probability of landslides		
	Energy	Extreme heat	- Blackouts and inability to cover demand load	Medium
		Droughts	- Blackouts and inability to cover demand load	High
- Higher maintenance costs				

Table 19: Risk Assessment

Receptors		Weather Sensitivity		Future Risk	Impact
Infrastructure	Water	Extreme precipitation	- Degrading water quality		Medium
		Extreme heat	- Water scarcity		Medium
			- Water quality issues		
	Droughts	- Water scarcity		High	
		- Water quality issues			
	Social	Extreme heat	- Increased needs for air-conditioned public spaces		Medium
		Droughts	- Increased numbers of people presenting respiratory problems and burdening the health care facilities		Medium
- Inability to cover the water demand					
		- Difficulties in the operation of certain facilities due to lack of water (e.g., swimming pools)			
Built Environment	Building Stock & Material	Extreme heat	- Concrete damages		Low
			- Increased cooling demands		
- Higher maintenance costs					
- Urban heat island effect					
		Droughts	- Higher water demand		Medium
Economy	Tourist	Extreme heat	- Change of the tourism season – lower tourist flows		Medium
			- Reduction of tourism related economy		
	Droughts	- Increased water supply costs		Medium	
		- Potential increase of indirect costs for the tourists (infrastructure related) and reduction of touristic flows			
	Agriculture	Extreme heat	- Changes in growth cycle		Medium
			- Damaged/loss of harvest		
			- Livestock loss and impacts on health		
- Lower crop yields					
Droughts	- Increased fire risks		High		
	- Damages / loss of harvest				
	- Lower crop yields				
	- Livestock loss and impacts on health				
			- Land degradation		
			- Increased fire risks		
Biodiversity	Green Zones & Forests	Extreme heat	- Fires and destruction of the ecosystem, flora, and fauna		Medium
		Droughts	- Fires and destruction of the ecosystem, flora, and fauna		Medium

An aerial photograph of a densely populated hillside, likely in a developing country. The buildings are multi-story and packed closely together, with some greenery interspersed. The sky is clear and blue. A large, bold, yellow number '4' is overlaid on the left side of the image.

4

Capacity
Building
& Local
Governance

Chapter 4: Capacity Building and Local Governance

4.1 Developing Capacity for Local Governance

Background

The municipality is disproportionately affected by climate change primarily due to its exposure to impacts as well as various constraints in resources. Local governance suffers from lack of technical know-how, financial and human resources, inflexible legislation and ineffective monitoring mechanisms – all of which prevent optimal climate change adaptation.

Developing capacity for local governance is essential to ensure the ownership, update and all-encompassing implementation of the SEACAP by the local authority.

Action

The development of SEACAP handling capacity cannot be undertaken individually by a municipality. This is to be part of a joint, mutual, interactive, and committed proceedings that involves several climate change local, national, and global actors; and would be part of wide ranged national local development engagement.

In such configuration, focus will be on formulating and accomplishing a Capacity Building National Programme to raise the SEACAPs' implementation capacities of cities that prepared them (and partly those that are planning to prepare theirs), in synergy with a SEACAP Support Mechanism, which principally associates national authorities that are responsible for NDC implementation and regional authorities (Governorate and Districts).

The first step is the identification of local capacity building needs, including specific skills to develop; and the organisational set up to consolidate and apply. After which, the methodology to employ would be broadly based on:

- Human resource development (HRD), which is the process of equipping the municipal team (and its partners from above national and regional actors) with the needed understanding of the SEACAPs and skills to implement it, with access to the necessary information and knowledge to fulfil this task. Some of the knowledge and skills required to carry out these tasks may be readily available. Others, such as working with the financial sectors will need to be developed before they can be applied.
- Instituting the organisational structure to appropriate, update and implement the SEACAP, which is the process to get things done collectively within the municipal orderliness. It is to do with management practices and procedures, rules and regulations and job descriptions. This also deals with legal and regulatory institutional changes that must be made and generally needs the patronage of national government legislative and executive authorities.
- Associating community-based organisations and/or local NGOs, as they rank very close to formal local

government in correlating priorities for capacity building, next to their role in mobilizing communities towards implementing the SEACAP.

Policies' support is necessary to bring about the proposed Capacity Building National Program, which necessitates to overcome constraints caused by outdated legislations, restrictive practices, outmoded equipment, and inappropriately trained staff; and to 're-tool' the local authorities, their national partners, enterprises and citizens to enable them to initiate and sustain the SEACAP operations, and to motivate and associate best professionals, technicians and managers[2].

There are situations, however, where the private sector - notably SMEs - need assistance in the form of training-guidance to best practices, next to application of legislative deregulation and provision incentives to enter the climate action market.

In the proposed Program context, the roles and practices of training establishments (e.g. universities, vocational training centres) would be reviewed and re-defines, leading to the development of a 'demand-led' training institutions that can support areas related to urban development planning and management in general and climate actions in particular. Their role is to go well beyond the traditional conduct of training or the design of performance improvement programmes. It must be much more proactive, assisting local authorities to initiate and implement managerial and, where necessary, structural changes, that will enable them to operate effectively in the context of the SEACAPs.

The operation of the proposed program, which would target municipalities that prepared the SEACAPs, will be addressed with both the NCG and the municipalities along the continuity of Clima-Med project (2022-2025).

Local policies wise, the proposed Capacity Building Program and the SSM would support enhancing the capacity of the municipality to:

- promote and if feasible undertake SEACAP's investments in municipality-owned assets, and set Public Private Partnerships (PPP), such as in energy efficiency and local energy generation based on renewable energy sources
- associate different partners in the processes;
- decide upon and provide, when feasible, climate action oriented urban services;
- select and/or influence over infrastructure development, first and foremost as prescribed in the SEACAP;
- influence and lay down supportive climate-related urban planning regulations.

[2] <https://www.urbanet.info/tag/governance-2/>

To apply public procurement that is green, sustainable, energy efficient and thus climate action, first and foremost, in SEACAPs and municipal actions to design, construct, and manage SE buildings, energy consuming equipment (HVAC, vehicles, and electrical equipment), and to the purchase of energy (e.g., electricity, gas) and to practices such as lifecycle costing, setting of minimum energy-efficiency standards, and use of energy-efficient criteria in the tendering process

As explained in detail in Chapter 7 of this SEACAP, the proposed Capacity Building Program and the SSM would support enhancing the municipality on the following:

- Web-based platforms, whose popularity is growing.
- Online tools to calculate CO2 reduction or energy savings estimations.
- Make use of databases containing examples of energy efficiency applications.
- Promote or conduct events related to SEACAP's actions, such as Energy Days and Info Points.

5

Mitigation
Actions

Chapter 5: Mitigation Actions

5.1 Buildings, Equipment, & Facilities

The building sector accounts for a big share of the overall CO₂ emissions in a city, thus, it is important to take specific measures to mitigate these emissions. This section proposes a set of actions applied to the three essential pillars of the building sector – municipal, residential, and tertiary.

5.1.1 Existing Municipal Buildings: Consumption Savings Measures

Background

The municipality has 4 buildings under its direct control and management consuming 970.3 MWh per year (2019) and producing 291 tCO₂-eq of emissions. The commitment of the municipal council in mitigating emissions through energy saving projects in municipal buildings and facilities will be a role model at the local level. These set of measures will enable the municipal staff to acquire the needed expertise in implementing energy efficiency actions and promoting the green economy at a local level.

Below are the municipality's proposed energy efficiency actions:

Mitigation

Description of the actions

Mapping the behaviour of energy consumption in municipal buildings along with energy audits identifies the basic measures to implement leading to energy savings.

Behavioural change through optimal use of energy and consumption savings measures leads to achieve a material amount of savings.

Energy audits are a useful tool for providing information needed to analyse current consumption and implement energy efficiency measures through long-term energy management.

Indicators will quantify the cost of implementing the measures. First, the municipality should assign an energy engineer able to lead the development of measures, identify the steps of implementation, and monitor the results.

Measures to be taken by the municipality are:

- Assign an energy expert to lead the work in municipal buildings as an energy performance advisor. With the expert, the municipality will set its vision and energy saving targets.
- Conduct energy audits in municipal buildings and facilities to identify the source of consumption, then list the measures reducing it and quantify the budget required.
- Identify the source of funding, apply the measures, and monitor the implementation with the energy expert.

The indicative measures may vary between measures reducing consumption and those improving energy efficiency and can be divided into short-term actions and long-term actions:

Short-term actions:

Implementing consumption saving measures, such as turning off the lights after leaving; using natural lighting whenever possible; using office equipment (PCs, printers, etc.) efficiently; adjusting air cooling and heating units according to the thermal calendar; and maintaining equipment and appliances.

Long-term actions:

Using high efficiency equipment through green procurement; replacing old office appliances with new highly efficient ones; using motion sensors in public places such as halls, bathrooms, and stairs; Retrofitting existing lighting with more efficient types such as LED lighting (this could be applied upon the end of existing lamp life); and improving roof and wall insulation.

Financial analysis

In the table below, the calculations for energy savings are presented based on assumptions which can be verified and revised at the time of implementation. Concerning the share of electricity consumption per

the original source of consumption, the calculation assumes lighting is 25% of municipal consumption, heating, ventilation, and air-conditioning (HVAC) 40%, and equipment and appliances 35%.

	Assumption's consumption estimation	Term of action	Proposed actions	Energy saving calculations assumptions	Energy saving per annual
Electricity consumption 69.30 MWh	Offices artificial Lighting contributes by 25% to the entire municipal building electrical consumption	Short term action	- Turning off the lights after leaving the place. - Focusing on the use of natural lighting whenever possible	5%	$25\% * 5\% * 69.30 = 0.87\text{MWh}$
		Long term action	- Install motion sensors for controlling lights in public places	1%	$25\% * 1\% * 69.30 = 0.173\text{ MWh}$
			- Replace the existing bulbs by a more efficient type as the LED lighting	50%	$25\% * 50\% * 69.30 = 8.66\text{ MWh}$
	Equipment contributes by 35% of entire municipal building electrical consumption	Short term action	- Efficient use of the office equipment (PCs, printers,...)	1%	$35\% * 1\% * 69.30 = 0.242\text{ MWh}$
		Long term action	- Using of high efficiency equipment in green procurement.	10%	$35\% * 10\% * 69.30 = 2.4\text{ MWh}$
	HVAC contributes by 40% of entire municipal building electrical consumption	Short term action	- Adjusting air cooling and heating units according to the thermal calendar, - Maintaining the equipment and appliances.	30%	$40\% * 30\% * 69.30 = 8.32\text{ MWh}$
Space heating consumption by fuel (Diesel) 890 MWh	Space heating	Long term action	- Improve the insulation of the roof and walls of the building	30%	$30\% * 890 = 267\text{ MWh}$
LPG heating Consumption 10.96 MWh	Space heating	Long term	- Improve the insulation of the roof and walls of the building	30%	$30\% * 10.96 = 3.3\text{ MWh}$
					291 MWh

* Energy saving (MWh)= Electricity consumption (MWh) x consumption per original source of consumption (%) x Energy saving based on assumptions (%)

The monetary energy savings have been calculated according to the energy costs at the time of preparing this report.

The energy savings have been calculated against the BEI consumptions and emissions for this category, although they are expected to be significantly more. The energy consumption of the existing buildings will increase and partly contribute to the BAU increased emissions, due to the more intensive use of the buildings, their further expansion etc. Such estimations will be more accurately depicted in future updates of the SEACAP.

Expected funding resources:

- Total annual energy saving is around 291 MWh amounting to around ILS 165,606 (EUR 43,057) of monetary savings.
- Budget: The calculated cost for this action is considered low and mainly focuses on the conduction

of energy audits, the adoption of low cost measures and the promotion of behavioural change, applying green procurement and following the manufacturer recommendation on the operation and maintenance of equipment.

- Climate cost efficiency: If these measures are implemented by 2030, the expected abatement generated is 87.15 tCO₂-eq/a accounting for 959 tCO₂-eq until 2040. The climate cost efficiency is equal to the implementation cost divided by the abatement of 959tCO₂- until 2040 according to the Paris Agreement..
- Source of finance: Most of the actions in municipal buildings can be achieved at affordable cost to the municipality. The expected funding resources will come from the municipal budget

Source of energy	Consumption in MWh	Annual Energy saving in MWh	Annual Monetary Savings in ILS (Euro)	Mitigation emission in tCO2-eq
Electrification	69.30	20.7	600*20.7 = 12,420 (Euro 3,229)	20.7*0.720= 14.9
Fuel (Diesel)	890	267	5.69*267*1000/10 = 151,923 (Euro 39,500)	267*0.268= 71.5
LPG	10.96	3.3	5.244* 3.3* 1000/13.7= 1,263 (Euro 328)	3.3 *0.227= 0.75
Total	970.26	291	165,606 (Euro 43,057)	87.15

*Annual Saving cost (Electricity) = Annual Energy saving (MWh) x cost of electricity (600 local currency /MWh)

*Annual Saving cost (Fuel Diesel) =Annual Energy saving (MWh) x cost of fuel diesel (5.69 local currency/L) x 1000/10.

5.1.2 New Municipal Buildings: Implementing & Promoting the Green Building Code

Background

The building sector is the leading contributor to energy consumption and represents the main area to be addressed in the SEACAP.

Green building practice goes beyond enacting legislation. Introducing a new buildings code in Palestine provides incentives for the environmentally friendly green buildings which conserve energy and rationalize consumption.

The energy consumption in the municipal buildings sector reached 970.30 MWh in 2019, and is expected to increase by 2040 to 3,260.2 MWh, if no measures are taken.

Currently, there is no obligatory legislation in the country, although it is a topic under consideration. The municipality will work nevertheless towards applying green building practices in the new buildings planned.

The suggested measures vary between applying green building codes on new buildings; using renewable energy; using electricity and water-saving appliances; insulating buildings; and greening areas surrounding the buildings by growing plants requiring minimal water.

Energy efficiency processes can be applied to design, renovation, operation of buildings.

Assuming that the additional consumption within the BAU scenario will be originating to approximately 50% from new buildings, these practices are estimated to reduce the BAU energy consumption and emissions by approximately 30%

Total	970.26	291	3,260.1	977.8	1,144.9	343.4

Description of the action

Energy efficiency of buildings

Ten steps are suggested to improve the energy efficiency of buildings – and implies also adopting measures regarding both thermal and electric energy (e.g., reducing wall transmittance in the former and using efficient appliances in the latter). This approach needs the full adherence of relevant national authorities and the Governorate. It leaves ample freedom to designers while supporting them in adopting solutions involving local climate, culture, and materials

1. Define explicitly the building objectives with a focus on thermal comfort
2. Assess microclimatic factors and intervene on the site layout and features which can affect indoor comfort
3. Control the heat gains at the external surface of the building envelope
4. Control and modulate heat transfer through the building envelope
5. Control the internal gains from appliances and lighting
6. Allow for local and individual adaptation
7. Use passive means and strategies to deliver and remove thermal energy to/from the building
8. Use HVAC systems assisted by natural (and renewable) energy sources
9. Use high efficiency active conventional heating and cooling plants, if still necessary
10. Train building managers and occupants on how to use, monitor the performance of, and adequately operate and maintain the building

Indicative suggestions for Improvement of the envelope and other aspects

One of the most common strategies for energy retrofit of buildings usually consists in reducing both thermal losses through the envelope and cooling loads and in controlling the solar heat gains.

The losses of energy through the envelope may be reduced by implementing several measures related to glazing and framing as well as wall and roof characteristics:

- Internal and external thermal insulation of walls reduces their transmittance values according to specific needs and location of the buildings. Commonly-used types of insulation in building construction include: fiberglass, polyurethane foam, polystyrene foam, cellulose insulation and rock wool. These materials also reduce the effect of thermal bridge as well as improve sound insulation and thermal inertia.
- Abatement of cooling loads is achieved by reducing solar radiation penetration using shading devices such as movable devices controlled manually or automatically; or internal and external blinds helping to control lighting level and uniformity plus stopping solar radiation from penetrating a room.
- Increased energy performance of buildings is achievable by operating on the heating system. The overall efficiency of the space heating/cooling system includes the efficiency of the generator and the losses of distribution, emission and inaccurate control systems.

General objectives

The aim of the actions undertaken by the municipality is to promote a green building code by raising awareness and guiding investment in energy efficiency measures in municipal buildings yielding energy savings.

Financial analysis

In the table below, the calculations for energy savings are presented based on assumptions which can be verified and revised at the time of implementation.

ENERGY SAVING CALCULATION BASED ON ASSUMPTIONS WHICH CAN BE VERIFIED AT TIME OF IMPLEMENTATION

Energy Source	Estimated consumption for new buildings (MWh)	Estimated emissions for new building tCO ₂ -eq	Estimated reduction on energy consumption based on green building code	Calculated saving in energy consumption MWh/a	Calculated saving emissions tCO ₂ -eq
Electricity	81.8	59.0	30%	24.5	17.7
Diesel	1,050.2	281.5	30%	315.1	84.4
LPG	12.9	2.9	30%	3.9	0.9
Total	1,144.9	343.4	30%	343.5	103.0

The calculated energy savings have been calculated according to the energy costs at the time of preparing this report.

Expected funding resources

- Total annual energy savings is around 343.4 MWh amounting to around ILS 195,428(EUR 50,811).
- Budget: The calculated cost for this action is zero. Applying green building code on new buildings, promoting behavioural change, applying green procurement, and following the manufacturer recommendations on operation and maintenance of equipment does not require significant additional cost. The cost of construction following the green building code will be considered in the budgeting of any new infrastructure construction.
- Climate cost efficiency: If these measures are implemented by 2027, the expected abatement generated is 102.88 tCO₂-eq/a accounting for 1,440 tCO₂-eq until 2040. The climate cost efficiency is equal to the implementation cost divided by the abatement of 1,440 tCO₂-eq until 2040 according to the Paris Agreement.
- Source of finance: Most of the actions in the new municipal buildings can be achieved at affordable cost to the municipality. The expected funding resources are the municipal budget used to finance the construction of the new infrastructure.

Source of energy	Consumption in MWh	Annual Energy saving in MWh	Annual Monetary Savings ILS (EUR)	Mitigated emissions in tCO ₂ -eq
Electrification	81.7	24.5	600*24.5 = 14,700 (Euro 3,822)	24.5*0.720=17.7
Fuel (Diesel)	1,050.2	315.1	5.69*315.1*1000/10 = 179,292 (Euro 46,618)	315.1*0.268=84.4
LPG	12.9	3.9	5.244*3.9*1000/13.7= 1,493 (Euro 388)	3.9*0.227= 0.9
Total	1,144.9	343.5	195,485 (Euro 50,828)	103.0

5.1.3 Existing Residential Buildings: Awareness Raising Activities

Background

Citizen engagement is of utmost importance since almost the 15.9% of energy consumption is due to the residential sector. The municipality's role should support its citizens in reducing their energy consumption bills, increasing their living standards, and preserving local natural resources. Awareness campaigns can influence customer consumption patterns and modify purchasing behaviour towards more energy efficient products. The municipality can use licensed ads and publish them at different times and has the initiative and ability to raise awareness in collaboration with various governmental parties, communities, and residents.

The suggested measures may need to be applied in collaboration with national authorities and the Governorate.

The residential sector is responsible for 25.9% of the city's emissions, therefore it is important to encourage citizens to consider energy saving as the most important action at the household level.

RESIDENTIAL BUILDINGS, ANNUAL ENERGY CONSUMPTION

Energy Source	Consumption (MWh) at base year 2019	Emissions (tCO ₂ -eq) at base year 2019
Electricity	22,000	15,840
Fuel used of cooking and space heating (LPG)	16,275.6	3,694.6
Total	38,275.6	19,534.6

Description of the action

Awareness raising campaigns for the city's residents should be organized frequently by the municipality through 2040 such as:

- Organizing "Energy Days" stressing the importance of energy saving and protecting the environment through simple actions such as modifying energy behaviour, exchanging incandescent lamps with fluorescent or LED lamps, purchasing high-efficiency appliances, and installing solar panels for water heating in existing buildings.

- Delivering freely available environmental documentaries.
- Participating in the WWF's "Earth Hour" where people across the world turn their lights off for one hour on a designated day.
- Issuing and distributing a booklet to households with tips for saving water and energy.

Holding awareness campaigns through the audio-visual communication means social media, lectures in schools as well as places of worship to motivate citizens to pursue sustainability and highlight its positive effects on the economy and society such as:

- **Water:** Rationalizing water consumption; demonstrating methods to reduce water consumption; holding campaigns to encourage residents to obtain a permit allowing them to build water harvesting tanks to store water within the existing residential structure conforming with modern buildings principles.
- **Electricity:** Encouraging residents to install solar water heaters, using energy-efficient lighting such as LED and setting air-conditioners at moderate temperatures in the summer or winter.
- **Insulating Buildings:** The importance of building insulation and the benefits.
- **Tree-planting:** Greening the areas around private buildings, and growing plants requiring minimum water.
- **Solid Waste:** Promoting sorting at the source, using degradable trash bags and using reusable grocery bags
- **Cooking:** Promoting the use of responsible cooking methods, rationalizing food waste and the use of kitchen utensils, achieving savings in the consumption of oils and fuels such as LPG using devices such as pressure cookers.

Note that Guidelines for the design and implementation of Citizens' Awareness Plans are detailed in Chapter 7 of this SEACAP.

In the table below, the calculations for energy savings are presented based on assumptions which can be verified and revised at the time of implementation

	Assumption consumption Estimation	Term of action	Proposed actions	Energy saving calculations assumptions	Energy saving
Electricity consumption 22,000 MWh	Electrical water heaters contribute by 20% of entire residential electrical	Long term action	Replacement of electric water heater by solar water heaters (SWH) Assuming 20% will apply	70%	$70\% * 20\% * 20\% * 22,000 = 616 \text{ MWh}$
	The dwellings artificial Lights contributes by 21% of entire residential electrical consumption	Short term action	Focusing on the use of natural lighting whenever possible and turning off the lights after leaving the place.	5%	$21\% * 5\% * 22,000 = 231 \text{ MWh}$
		Long term action	Replace existing non efficient lights by efficient type as the LED lighting. Assuming 50% will apply.	50%	$21\% * 50\% * 50\% * 22,000 = 1,155 \text{ MWh}$
	Home Appliances: Refrigeration contributes by 12%. Washing machines contributes by 8%. TV, computers mobile chargers ... contributes by 4% of entire residential electrical consumption.	Long term action	Replacement of existing refrigerators and freezers by new energy efficient A+++ rated ones. Assuming 50% will apply.	50%	$12\% * 50\% * 30\% * 22,000 = 396 \text{ MWh}$
		Long term action	Replacement of existing washing machines, by new energy efficient A+++ rated ones. Assuming 20% will apply.	10%	$8\% * 10\% * 20\% * 22,000 = 35.2 \text{ MWh}$
		Short term action	Efficient use for the TV, computers and other small electrical equipment.	1%	$4\% * 1\% * 22,000 = 8.8 \text{ MWh}$
	Air-conditioning contributes by 35% of entire residential electrical consumption	Short term action	Adjusting air cooling and heating units according to the thermal calendar. Maintaining the equipment and appliances. Assuming 30% will apply.	30%	$35\% * 30\% * 30\% * 22,000 = 693 \text{ MWh}$

Electricity consumption 22,000 MWh		Long term action	Replacing the old air-condition with efficient one. Assuming 20% will apply.	20%	$35\% * 20\% * 20\% * 22,000 = 308$ MWh
Space heating and cooking consumption. Fuel type (LPG) 16,275.60 MWh	Space Heating & cooking	Long term action	Improve the insulation of the roof and walls of the building. Promote the use of responsible cooking methods and use of pressure cookers. Assuming 10% will apply.	10%	$10\% * 10\% * 16,275.6 = 163$ MWh
Calculated energy saving					3,606 MWh

*According to Palestinian Energy Authority (PEA), about 62% of households had solar water heater in 2013 source <https://fada.birzeit.edu/jspui/bitstream/20.500.11889/5496/1/C-19.pdf>

*Assumptions for electrical consumption and savings are based on Ruble & Karaki Energy policy 52(2013)608-617 <https://www.sciencedirect.com/science/article/pii/S0301421512008749>

The following table indicates annually mitigated emissions and the energy savings:

Source of energy	Consumption as in MWh	Annual Energy saving in MWh	Annual Monetary Saving in local currency (LC) and in (Euro)	Mitigation emission in tCO ₂ -eq
Electrification	22,000	3,443	$600 * 3,443 = 2,065,800$ (Euro 537,130)	$3,443 * 0.720 = 2,479.0$
Fuel (LPG)	16,275.6	163	$5.244 * 163 * 1000 / 13.7 = 62,392$ (Euro 16,222)	$163 * 0.227 = 37$
Total	38,275.6	3,606	2,128,192 LC (Euro 553,352)	2,516.0

According to Palestinian Energy Authority (PEA), about 62% of households had solar water heater in 2013 source <https://fada.birzeit.edu/jspui/bitstream/20.500.11889/5496/1/C-19.pdf>

*Assumptions for electrical consumption and savings are based on Ruble & Karaki Energy policy 52(2013)608-617 <https://www.sciencedirect.com/science/article/pii/S0301421512008749>

*Assumptions for electrical consumption and savings are based on Ruble & Karaki Energy policy 52(2013)608-617 <https://www.sciencedirect.com/science/article/pii/S0301421512008749>

The return on investment is estimated at EUR 553,352 per year.

The energy savings have been calculated against the BEI consumptions and emissions for this category, although they are expected to be significantly more. The energy consumption of the existing buildings will increase and partly contribute to the BAU increased emissions, due to the more intensive use of the buildings, their further expansion etc. Such estimations will be more accurately depicted in future updates of the SEACAP.

Expected funding resources:

- Total annual energy savings from the residential sector is around 3,606 MWh amounting to around ILS 2,128,192 (EUR 553,352) of monetary savings.
- Budget: Estimated to cost EUR 650,000 for awareness-raising activities.
- Climate cost efficiency: If these measures are implemented by 2030, the expected abatement generated is 2,516.0 tCO₂-eq/a accounting for 27,676 tCO₂-eq until 2040. The climate cost efficiency is equal to the implementation cost divided by the abatement until 2040 according to the Paris Agreement.
- Source of finance: The homeowner should pay for all costs for greening the building, however the municipality has a role in promoting greening of the existing buildings, either from the municipal budget or through innovative outsourcing.

5.1.4 New Residential Buildings: Implementing & Promoting Bioclimatic Building Practices

Background

Palestine suffers from a shortage of natural resources, especially energy and water, and imports nearly 100% of its energy needs from Israel and neighbouring countries.

Energy consumption in the city's residential buildings reached 38,275.6 MWh in 2019 and is expected to reach 128,606 MWh by 2040, if no actions are taken.

Currently, there is no obligatory legislation on the topic in the country, although it is under consideration. The municipality will work towards promoting green building practices and applying the legislation, which is expected to be mandatory by 2030.

If green building practices are applied, it is estimated that 25-35% less energy than traditional buildings in the country will be used and approximately 40% less water. This means lower electricity and water bills for those living in such buildings as well as less reliance on imported energy overall.

Palestine lacks sustainable building policies and government incentives, plus urban planning and land use policy is controlled by Israel. Therefore, it is important to rely on local initiatives and encourage local communities to follow green building standards. The municipality could guide citizens to green building standards when processing applications for building permits.

Assuming that the additional consumption within the BAU scenario will be originating to approximately 50% from new buildings, these practices are estimated to reduce these buildings' BAU energy consumption and emissions by approximately 30%.

RESIDENTIAL SECTOR ANNUAL ENERGY CONSUMPTION

ENERGY SOURCE	Consumption (MWh) at base year 2019	Emissions (tCO2-eq) at base year 2019	BAU Consumption (MWh)* at 2040	BAU Emissions tCO2-eq at 2040	New buildings' BAU consumption (MWh)	New buildings' BAU emissions (CO2 eq)
ELECTRICITY	22,000.0	15,840.0	73,920.0	53,222.4	25,960.0	18,691.2
LPG	16,275.6	3,694.6	54,686.0	12,413.9	19,205.2	4,359.7
Total	38,275.6	19,534.6	128,606.0	65,636.3	45,165.2	23,050.9

Average Consumer Prices in Palestine for LPG (local currency) year 2019 equal to 62.93 /12 kg and equal to 16.3618 euro /12 kg. the default factors of IPCC (2006) Fuel: Emissions Factor tCO2-eq/MWh LPG 0.227 Fuel: Conversion Factor for LPG 13.7 kWh/kg

SAVINGS' CALCULATION FOR CONSUMPTION & EMISSIONS OF NEW RESIDENTIAL BUILDINGS

	New buildings' BAU consumption (MWh)	New buildings' BAU emissions (CO2 eq)	Savings due to bioclimatic building practices	Energy savings (MWh)	Emissions savings (CO2 eq)
ELECTRICITY	25,960.0	18,691.2	30%	7,788.0	5,607.4
LPG	19,205.2	4,359.7	30%	5,761.6	1,307.9
Total	45,165.2	23,050.9	30%	13,549.6	6,915.3

Suggested measures vary between promoting green building and other measures including:

- Using water storage tanks in modern buildings during winter, and in other scarcity periods.
- Installing solar water heaters to reduce electricity consumption.
- Using thermal insulation to reduce energy consumption in buildings by preventing heat loss.
- Greening areas surrounding the buildings and growing plants requiring minimal water.
- Providing car parking for buildings.
- Using surface rebound and construction ratios.
- Using heat insulated windows.

Description of the action

The following indicative measures can be reviewed and updated by municipal council and stakeholders:

- Work with national and regional authorities and stakeholders to prepare a green building recommendations guide which can be used with new building licences.
- Conduct awareness raising campaigns addressing citizens on the importance of green buildings, aimed at protecting the environment as well as reducing costs and encouraging citizens to impose pressure on real estate developers. This would be achieved through audio-visual communication means, social media, lectures held in schools and places of worship to encourage them to use environmental friendly renewable energy sources and recognize their positive effects on the economy and society.

General objectives

The aim of the actions undertaken by the municipality is to reduce consumption and pollution caused by burning fuel to generate electricity as well as save consumption costs while reducing government subsidies to support the energy sector, thus easing the burden on citizens in multiple ways.

Financial analysis

In the table below, the calculations for energy savings are presented based on assumptions which can be verified and revised at the time of implementation.

MONETARY SAVINGS' CALCULATION

	Energy savings (MWh)	Emissions savings (CO2 eq)	Annual Monetary Savings, ILS (EUR)
Electricity	7,788.0	5,607.4	$600 * 7,788 =$ ILS 4,672,800 (EUR 1,214,928)
LPG	5,761.6	1,307.9	$5.244 * 5,761.6 * 1000 / 13.7 =$ ILS 2,205,389 (EUR 573,424)
Total	13,549.6	6,915.3	ILS 6,878,189 (EUR 1,788,352)

Average Consumer Prices in Palestine for LPG year 2019 equal to 62.93 (local currency) /12 kg and equal to 16.3618 euro /12 kg.

Emissions Factor tCO₂-eq/MWh LPG 0.227 Fuel: Conversion Factor for LPG 13.7 kWh/kg(the default factors of IPCC (2006) Fuel).

The monetary energy saving have been calculated according to the energy costs at the time of preparation of this report.

Expected funding resources:

- The total energy saving in the residential sector is around 13,550 MWh and it counts for 6,878,189 in local currency or 1,788,352 euro.
- Budget: estimated 480,000 for awareness- raising activities.
- Climate cost efficiency: If these measures are implemented by 2030, the project is expected to generate an abatement of 6,915.3 tCO₂-eq/a and will count for 76,068.3 tCO₂-eq until 2040.
- The climate cost efficiency is equal to the implementation cost divided by the abatement of 76,068.3 tCO₂-eq until year 2040 according to the Paris agreement.
- Source of finance: the house owner should pay for all cost for greening the building, however the municipality have a role in promoting the greening of the new buildings, either from the municipal budget or can look for outsourcing the fund through innovation way.

5.1.5 Existing Tertiary Buildings: Awareness Raising Activities

Background

The tertiary sector represents the non-municipal and non-residential buildings, equipment, and facilities (e.g., example shops, offices, banks, commercial and retail activities, schools, hospitals) which consume around 2.4% of the energy consumed in the building sector.

The municipality's role along with the stakeholders should be support the tertiary sector in reducing its energy consumption bill by highlighting the most important measures to change their consumption behaviour and to take actions toward energy efficiency and renewable energy use.

It should also be stressed that due to the status quo situation in the Gaza strip, the electricity is only available for 8 hours daily. This means that the tertiary sector is under-consuming, and a differentiation in the situation would increase energy needs.

TERTIARY BUILDINGS, ANNUAL ENERGY CONSUMPTION AND EMISSIONS

ENERGY SOURCE	Consumption (MWh) at base year 2019	Emissions (tCO ₂ -eq) at base year 2019
ELECTRICITY	830	597.6
LPG	141.1	32
Total	971.1	629.6

Description of the action

This action will be conducted in coordination and in complementarity with the Governorate's action.

Awareness raising campaigns for the city's residents should be organized frequently by the municipality through 2040 and involve common actions for all types of tertiary buildings:

a.Replacement of inefficient old lamps: Indoor illumination of tertiary-sector buildings use the largest proportion of electrical energy. The most common strategy is replacing old inefficient lamps with new, better performing ones. In a typical lighting system only 30% of the lumens emitted by the lamp contribute to the lit environment with huge losses due to the luminaire, the light absorption on surrounding surfaces and the light redirection to avoidable areas. Additional factors influencing energy consumption due to lighting: (1) the choice of the type of lamp; (2) the displacement of lamps; (3) the relation between lamp and luminaires; and (4) the lumen per watt. Plus, using natural light during daylight hours limits the use of artificial light reducing electrical consumption and thermal load while improving comfort.

b.Smart use and adopting thermometer calendars in air-conditioning with programmable timers will help in reducing energy consumption as every degree matters! Setting your thermostat at a comfortable temperature won't make your unit work too hard, but will still make you feel like you're comfortable.

c. The use of **inverter type air-conditioning** reduces energy consumption and lowers energy bills.

d.Regulate water use and use of a tap adaptor to reduce water consumption. This could be applied in public areas and can be heavily implemented in mosques and will rationalise water consumption.

e. Replace electrical water heaters with **solar water heaters** in restaurants, clinics, mosques, etc.

f. Efficient office appliances: Energy savings in appliances are possible through selecting energy-efficient products..

More specific actions for large and more complex buildings such as hospitals, shopping malls, etc. include:

a. Behaviour change: Adequate behaviour of large building occupants may also generate significant savings.

b. The management of technical installations in large modern buildings may lead to energy savings: make sure heating is turned off during weekends, holidays, and after work. Also, fine tune heating/cooling by setting temperatures. For simple buildings, a technician or an energy manager could be appointed for such tasks. For complex buildings, the help of a specialised company may be necessary. Therefore, it may be necessary to renew

or set up a new contract with a competent maintenance company with adequate requirements in terms of energy performance.

c. Improving the performance of large modern buildings through retro-commissioning: This process improves the efficiency of an existing building's equipment and systems and involves a systemic evaluation of opportunities to improve energy-using systems. It can often resolve problems occurring during design or construction, or address problems developed throughout the building's life as equipment has aged, or as building usage has changed (e.g., bringing equipment up to its proper operational state, improving indoor air quality, increasing equipment lifespan, improving maintenance operations). Retro-commissioning will identify and fix: (1) Equipment or lighting on when unnecessary; (2) systems that simultaneously heat and cool; (3) belts and valves not functioning properly; (4) thermostats and sensors out of calibration; (5) air balancing systems less than optimal; (6) economizers not working as designed; (7) control sequences functioning incorrectly; (8) variable-frequency drives operating at unnecessarily high speeds or at a constant speed even though the load being served varies.

d. Improving the building thermal envelope through walls and roof insulation, white reflective paints on roofs, and integration of double-glazed windows. Promoting efficient pressure cookers in the restaurants, hospitals, hotels, etc.

Note that Guidelines for the design and implementation of Citizens' Awareness Plans are detailed in Chapter 7 of this SEACAP.

There is no official study available at the time of this report's preparation regarding energy consumption in the tertiary sector and the estimated contributions of lighting, office equipment, etc. The calculations for energy savings, presented in the table below, are based on assumptions using information from the European Council for an Energy Efficient Economy, and will be verified and revised at the time of implementation.

	Assumption consumption estimation	Term of action	Proposed actions	Energy saving calculations	Energy savings (MWh)
Electrification consumption 4,110 MWh	The artificial Lights contributes based on assumption that lighting represents 25% of entire building electrical consumption	Short term action	- Turning off the lights after leaving the place. - Focusing on the use of natural lighting whenever possible.	5%	$25\% * 5\% * 830 = 10.3 \text{ MWh}$
		Long term action	- Install motion sensors for controlling lights in public places	1%	$25\% * 1\% * 830 = 2 \text{ MWh}$
			- Replace the existing lighting by a more efficient type Assuming 100% will apply by 2040	50%	$25\% * 50\% * 830 = 104 \text{ MWh}$
	Electrical equipment contributes based on assumption that equipment represents 35% of entire building consumption	Long term action	- Use of efficient office appliances - Replace electrical water heater with Solar one Assuming 50% will apply	10%	$35\% * 10\% * 50\% * 830 = 14.5 \text{ MWh}$
	Air-conditioning contributes based on assumption that AC represents 40% of entire building electrical consumption	Short term action	- Adopting thermometer calendars in air-conditioning with programmable timer - Regular maintaining the equipment and appliances.	30%	$40\% * 30\% * 50\% * 830 = 49.8 \text{ MWh}$
		Long term action	- Use of Inverter type AC Assuming 50% will apply		
LPG Space heating consumption 141.1 MWh	Space heating of entire fuel consumption	Long term action	- Improve the insulation of the roof and walls of the building Assuming 10% will apply	30%	$30\% * 10\% * 141.1 = 4.23 \text{ MWh}$
Total					184.8 MWh

The energy savings have been calculated against the BEI consumptions and emissions for this category, although they are expected to be significantly more. The energy consumption of the existing buildings will increase and partly contribute to the BAU increased emissions, due to the more intensive use of the buildings, their further expansion etc. Such estimations will be more accurately depicted in future updates of the SEACAP.

Financial analysis

Source of energy	Consumption (MWh)	Annual Energy saving (MWh)	Annual monetary saving in local currency (LC) and in (Euro)	Mitigation emission in tCO2-eq
Electrification	830	180.6	600 * 180.6 = 108,360 (Euro 28,175)	180.6 * 0.720 = 130.0
LPG	141.1	4.2	5.244 * 4.2 * 1000 / 13.7 = 1,619 (Euro 421)	4.2 * 0.227 = 1.0
Total	971.1	184.8	109,979 LC (Euro 28,596)	131.0

The return on investment is estimated at EUR 42,430 per year.

Expected funding resources:

- Total annual energy savings from the tertiary sector is around 184.8 MWh amounting to around ILS 109,979 (EUR 28,596) of monetary energy savings.
- Budget: Estimated to cost EUR 40,000.
- Climate cost efficiency: If these measures are implemented by 2030, the expected abatement generated is 131 tCO2-eq/a accounting for 1,441 tCO2-eq until 2040. The climate cost efficiency is equal to the implementation cost divided by the abatement of until 2040 according to the Paris Agreement.
- Source of finance: The tertiary building owners should pay for all costs for greening the building, however the municipality has a role in promoting greening of the existing buildings, either from the municipal budget or through innovative outsourcing.

5.1.6 New Tertiary Buildings: Implementing & Promoting the Green Building Code

Background

Palestine suffers from a shortage of natural resources, especially energy and water, and imports nearly 100% of its energy needs from Israel and neighbouring countries.

In 2019, the city's energy consumption in the tertiary sector was 971.1 MWh, and is expected to reach 3,263 MWh by 2040.

Currently, there is no obligatory legislation on green building codes in the country, although it is under consideration. The municipality will work towards promoting green building practices and applying the legislation, which is expected to be mandatory by 2030.

If green building practices are applied, it is estimated that 25-35% less energy than traditional buildings in the country will be used and approximately 40% less water. This means lower electricity and water bills for those who will live in such buildings, as well as less reliance on imported energy.

Since Palestine lacks sustainable building policies, lacks incentives from the government and lacks urban planning and land use policy that is controlled by Israel, it is therefore important to rely a lot on initiatives and encourage the local community to follow green build standards. Here comes the role of the municipality in guiding citizens to adhere to green building standards when submitting an application for a building permit.

Assuming that the additional consumption within the BAU scenario will be originating to approximately 50% from new buildings, these practices are estimated to reduce the BAU energy consumption and emissions by approximately 30%, as presented in the tables below.

LPG	166.5	37.7	30%	50.0	11.3
Total	1,145.9	742.9	30%	343.8	222.9

Description of the action

The core activities for raising awareness about a green building code plays important roles in promoting green building standards benefitting the municipality which can encourage practices lowering the city's environmental footprint as well as developers and owners who can invest in green buildings offering lower utility bills and attracting corporations wanting to demonstrate their commitment to sustainability.

The municipality with the support of stakeholders can play a vital role in reducing energy demand in the tertiary sector.

The following indicative approach for green buildings was obtained from the World Green Council:

Taking an intelligent approach to energy

- Minimising energy use in all stages of a building's lifecycle, making new and renovated buildings more comfortable and less expensive to run, and helping building users learn to be efficient too.
- Integrating renewable and low-carbon technologies to supply buildings' energy needs once their design has maximised inbuilt and natural efficiencies.

Safeguarding water resources

- Exploring ways to improve drinking and wastewater efficiency and management, harvesting water for safe indoor use in innovative ways, and generally minimising water use in buildings.
- Considering the impact of buildings and their surroundings on storm water and drainage infrastructure, ensuring these are not put under undue stress or prevented from doing their job.

Minimising waste and maximising reuse

- Using fewer, more durable materials and generating less waste, as well as accounting for a building's end of life stage by designing for demolition waste recovery and reuse.
- Engaging building users in reuse and recycling.

Promoting health and wellbeing

- Bringing fresh air inside, delivering good indoor air quality through ventilation, and avoiding materials and chemicals creating harmful or toxic emissions.
- Incorporating natural light and views to ensure building users' comfort and enjoyment of their surroundings while reducing lighting energy needs in the process.
- Designing for ears as well as eyes. Acoustics and proper sound insulation play important roles in helping concentration, recuperation, and peaceful enjoyment of a building in educational, health, and residential buildings.
- Ensuring people are comfortable in their everyday environments, creating the right indoor temperature through passive design or building management and monitoring systems.

Keeping our environment green

- Recognising that our urban environment should preserve nature while ensuring diverse wildlife and land quality are protected or enhanced, by, for example, remediating and building on polluted land or creating new green spaces.
- Looking for ways we can make our urban areas more productive, bringing agriculture into our cities.

Creating resilient and flexible structures

- Adapting to our changing climate, ensuring resilience to events such as flooding, earthquakes, or fires so that our buildings stand the test of time and keep people and their belongings safe.
- Designing flexible and dynamic spaces, anticipating changes in their use over time, and avoiding the need to demolish, rebuild, or significantly renovate buildings to prevent them from becoming obsolete.

Connecting communities and people

Whenever realistically applicable

- Creating diverse environments that connect and enhance communities, asking what a building will add to its context in terms of positive economic and social effects, and engaging local communities in planning.
- Ensuring transport and distance to amenities are considered in design, reducing the impact of personal transport on the environment, and encouraging environmentally friendly options such as walking or cycling.

Considering all stages of a building's lifecycle

Whenever realistically applicable

- Seeking to lower environmental impacts and maximise social and economic value over a building's whole lifecycle (from design, construction, operation, and maintenance, through to renovation and eventual demolition).
- Ensuring resources such as energy or water used to produce and transport the materials in the building are minimised so that buildings are truly low impact.

Financial analysis

In the table below, the calculations for energy savings are presented based on assumptions which can be verified and revised at the time of implementation.

MONETARY SAVINGS CALCULATION

ENERGY SOURCE	Energy savings (MWh)	Emissions savings (CO2 eq)	Monetary Energy Savings, ILS (EUR)
ELECTRICITY	293.8	211.6	$600 * 293.8 =$ ILS 176,280 (EUR 45,835)
LPG	50.0	11.3	$5.244 * 50 * 1000 / 13.7 =$ ILS 19,139 (EUR 4,976)
Total	343.8	222.9	ILS 195,419 (EUR 50,811)

Average Consumer Prices in Palestine for LPG year 2019 equal to 62.93 (local currency) /12 kg and equal to 16.3618 euro /12 kg.
Emissions Factor tCO₂-eq/MWh LPG 0.227 Fuel: Conversion Factor for LPG 13.7 kWh/kg (the default factors of IPCC (2006) Fuel).

The monetary energy savings have been calculated according to the energy costs at the time of preparing this report.

Expected funding resources:

- Total annual energy savings from the tertiary sector is around 344 MWh amounting to around ILS 195,419 (EUR 50,811) of monetary savings.
- Budget: Estimated to cost EUR 50,000.
- Climate cost efficiency: If these measures are implemented by 2030, the expected abatement generated is 222.9 tCO₂-eq/a accounting for 2,451.9 tCO₂-eq until 2040. The climate cost efficiency is equal to the implementation cost divided by the abatement of until 2040 according to the Paris Agreement.
- Source of finance: The tertiary building owner should pay for all costs for greening the building, however the municipality has a role in promoting greening of the existing buildings, either from the municipal budget or through innovative outsourcing.

5.2. Municipal Public Lighting

Background

With outdated, inefficient street lighting systems, a significant amount of municipal energy budget goes on street lighting.

Modern LED lighting solutions are advancing rapidly and can deliver significant energy saving potentials. Increasing efficacy, optimized luminaire design, and flexible lighting control enable enhanced performance at lower cost for different lighting and traffic conditions.

Advanced technology nowadays can offer 30-70% of electrical energy savings from the public lighting sector. The street lighting improvement project can include using LED technology, smart LED drivers, and astronomical timers. Intelligent control systems create additional savings as the lighting level can be adjusted depending on the time of day and other requirements.

Description of the action

Replacing old street lighting with a modern type saving energy will provide better quality lighting, reduce light pollution, and lower maintenance costs. The municipality should:

- **Develop a master plan** for the city identifying streets and paths with recommended types and models of street light luminaires to be used.
- **Modernise the protection components** of street light systems by installing:
 - Surge protection on feeders and pole sides
 - Proper grounding systems
 - Overload and short-circuit protections
 - Astronomical timers
 - Switching components
 - Energy consumption metering
 - Differential relays
 - Permanent over-voltage protection
- **Procure, install, and maintain the new lights** along with necessary protection devices and control systems. The procurer should specify the streets and paths for which the street lighting system will be designed or lighting system components will be procured. The system will be specified based on the standard EN13201 and related national standards. Among other things, the procurer will specify illuminance levels, uniformity levels, and system maintenance factors.
- **Obtain the measurement for light distribution** before and after the work is completed.
- **Setup an operational and maintenance plan** for public lighting.
- **Conduct training on operation and maintenance** for the technical staff to ensure quality of services and to extend the lifespan of the components.

General Objectives

Modern public lighting systems positively impact social aspects of the city including traffic safety, crime rates, productivity (due to security at night) as well as cost-oriented aspects such as reduced costs due to energy efficiency, plus environment-related parameters such as reduced toxic gases and emissions.

*Annual consumption x BAU coefficient 3.36 for the base year of 2019

PLANNED REPLACEMENT FOR PUBLIC STREET LIGHTS

Type of street lamps	Quantities	Watt per lamp	Annual consumptions in MWh	Energy saving in MWh
LED	250	70	77.0	88.0
LED	950	70	292.6	229.9
LED	430	40	75.7	56.8
LED	170	100	74.8	0.0
Total			520.1	374.7

The expected results from replacing the street lighting system are shown in the table below:

Key Actions & Measures	BAU Scenario		Mitigation		Mitigation, %	Cost, EUR
	MWh/A	TCO ₂ /A	MWh/A	TCO ₂ /A		
Public Street Lighting	3,006.3	2,164.6	624.1	449.4	20.8%	417,600
Developing master plan	3,006.3	2,164.6				5,000
Modernize protection components			249.4	179.6		80,600
Procure, install, maintain new lights			374.7	269.8		326,000
Obtain measurements for light distribution						2,000
Setup operational & maintenance plan						2,000
Conduct training for operations & maintenance						2,000

Expected funding resources

- Total annual energy savings from the street lighting sector is around 624.1 MWh amounting to around ILS 374,400 (EUR 97,344) of monetary savings.
- Budget: Estimated to cost EUR 417,600.
- Climate cost efficiency: If these measures are implemented by 2027, the expected abatement generated is 449.4 tCO₂-eq/a accounting for 6,291.6 tCO₂-eq until 2040. The climate cost efficiency is equal to the implementation cost divided by the abatement of tCO₂-eq until 2040 according to the Paris Agreement.
- Source of finance: Municipality can finance the project whenever changing any lamp, change it to LED; partnerships with the private sector; through energy performance contract (EPC); and many other forms of financial mechanisms.

5.3 Transportation

Background in Palestine

The uniqueness of the Palestinian case is considered a model of the complex interrelationship between military occupation, environmental degradation, and sustainable development. Palestinians do not have many choices regarding transportation and are restricted to traditional transit modes (urban and para transit modes). The urban transit mode, which is considered a highly specialized mode, includes traditional mass transit such as buses and streetcars. The para transit mode includes shared taxi services. More than 6.8% of the total road network length in the West Bank are bypass roads. Secondary roads are dense in the Palestinian urban peripheries and typically 4-8 meters wide. Most of these secondary roads are in despair as they serve more than their designed operational capacities.

Most Palestinian cities have witnessed rapid growth in transport demand, yet because of insufficient public transport services there has been an excessive reliance on private vehicles. The transport sector in the city includes only road transport and comprises subcategories such as the municipal fleet and private transport while there are no public transport services in the city. According to the municipality, the municipal fleet of 14 vehicles includes passenger vehicles; light, medium, and large trucks; construction machinery; and other vehicles. The fuels used for the municipal fleet are gasoline and diesel. Regarding private cars, fuel consumption is calculated by the municipality based on the total numbers of cars in the region, the average travelled distance, and the average consumption per kilometre for each type of vehicle. The same approach is used for commercial vehicles and private/public transportation.

The table below presents the data for annual diesel and gasoline consumption:[4]

MUNICIPAL, PRIVATE TRANSPORT ANNUAL FUEL CONSUMPTION AND CO2 EMISSIONS

Transportation sector	Diesel (L)	Gasoline (L)	Fuel Consumption MWh	Emissions tCO2-eq	Based on BAU the demand for energy (MWh) at 2040	Based on BAU emissions tCO2-eq at 2040
Municipal fleet	55,600		556	149	1,868	500
Private sector	15,562,500	3,170,000	184,789	48,999	620,891	164,636
Total	15,618,100	3,170,000	185,345	49,148	622,759	165,136

*Emission factor for diesel 0.268 in (tCO2-eq/MWh) *Emission factor for Gasoline 0.25 in (tCO2-eq/MWh) *Conversion factor for diesel 0.010 in (MWh/L) *Conversion factor for Gasoline 0.0092 in (MWh/L)

5.3.1 Road Asset Planning & Management with Sustainable Mobility Measures

Background

In the city around 2,735 private vehicles are moving on daily basis emitting a considerable quantity of CO2. The peak hours of congestion are in the morning around 8:00 am and in the afternoon between 2:00 pm and 4:00 pm as residents are moving to their jobs and students to their schools then returning homes. During the working hours, there is traffic congestion the whole day. In addition to the absence of public transportation in the region makes citizens' transport between the regions difficult and costly. Implementing measures and actions to improve and enhance citizens' transport is crucial in establishing a sustainable and environmentally friendly transport system.

In table below, the transportation sector contributes 65.2% of city emissions:

TRANSPORT SECTOR, ANNUAL FUEL CONSUMPTION

SITE CATEGORY	Consumption (MWh) at base year 2019	Emissions (tCO2-eq) at base year 2019	Based on BAU the demand for energy (MWh) at 2040	Based on BAU emissions tCO2-eq at 2040

[4] Journal of Nature Science and Sustainable Technology ISSN 1933-0324 Volume 2, Issue 3

Description of the Action

This action will be conducted in coordination and in complementarity with the Governorate's action and after assessment of the sector's capacity and plans to be modernized and upgraded.

- 1. Long-term vision** for road asset management at the township level, securing road connectivity to form a continuum of arterial field paths, and reliable access to social, economic, and administrative services.
- 2. Improve road network planning** to develop rural areas based on best practices from urbanisation, agriculture, and industry as well as livelihoods promotion, passenger transportation, access to socio-economic services, and achieving SDGs. Strengthen local community and governance institutions to play a proactive role in planning and maintaining public transportation services and road safety.
- 3. Road asset management** is the strategic and systemic process of operating, maintaining, upgrading, and expanding physical road assets throughout their lifecycle while improving network efficiency. This may require introducing a hierarchy of roads, integrating with other transport modes, and incorporating economic growth and strategic requirements.
- 4. Sustainable mobility** measures for minimising the use of conventional private vehicles and increasing the means of sustainable transport have three pillars:
 - **Active mobility.** People can shift their mobility habits from car to walking and cycling as a substantial portion of car trips cover less than five kilometres. These two options can contribute both to achieving energy and climate goals as well as to several benefits personal and civic. Some of the benefits improve public health, reduce road temperature, better air quality, lower noise levels, reduce congestion, and create more free spaces reducing road accidents.
 - **Shared/collective mobility.** Shared mobility means a bold promotion of the solutions based on the public transportation system and the collective use of the available cars. Public transport must be established and put at the forefront of sustainable mobility measures, both environmental/health issues and car reduction goals. Moreover, it encourages accessibility and equity, providing low-income people (with no car) with affordable mobility solutions and breaking the isolation barriers of distant communities. Apart from public transportation, other collective forms of mobility can be taxi multi-use, car-sharing, ride-sharing, bike-sharing, and demand-responsive transport, helping people be less reliant on private vehicles.
 - **Sustainable mobility awareness.** This pillar includes "soft measures" toward changing travel attitudes and behaviours to reduce single-occupancy car use. Such measures can be public/business incentives to increase cycling and walking to work, awareness-raising campaigns, info points, school/authority/ company travel plans, and apps for mobility gamification. Soft measures can pave the way for the effectiveness of hard measures and, moreover, requires only a small portion of the total transportation investments.

General Objectives

1. Combat social exclusion by providing opportunity to travel for all in rural areas
2. Improve access between villages and urban centres
3. Optimise resources by efficient routing, ride-matching, and dispatching
4. Integrate rural transport services with existing transport options

Financial analysis

In the table below, the calculations for energy savings are presented based on assumptions which can be verified and revised at the time of implementation.

ENERGY SAVING CALCULATION BASED ON ASSUMPTIONS WHICH CAN BE VERIFIED AT TIME OF IMPLEMENTATION

SITE CATEGORY	BAU the demand for energy (MWh) at 2040	BAU emissions tCO ₂ -eq at 2040	Estimated saving assumption, %	Calculated energy saving MWh/a	Calculated saving emissions tCO ₂ -eq
TRANSPORT SECTOR	622,759	165,136			
Improve road network planning			2%	12,455	3,303
Road asset management			3%	18,683	4,954
Sustainable Mobility			2%	12,455	3,303
Total			7%	43,593	11,560

Average Consumer Prices in Palestine for fuel (Gasoline) year 2019 equal to 6.14 (local currency) per litre and equal to 1.5964 euro per Litre.*Emission factor for diesel 0.268 in (tCO₂-eq/MWh) *Emission factor for Gasoline 0.25 in (tCO₂-eq/MWh) *Conversion factor for diesel 0.010 in (MWh/L) *Conversion factor for Gasoline 0.0092 in (MWh/L)

Source of energy	Consumption litre	BAU 2040	Annual monetary savings in local currency (ILS) and in (Euro)
Fuel (Diesel)	15,618,100	15,618,100*3.36 = 52,476,816	7% * 52,476,816* 5.69 = 20,901,515 LC (5,434,394 Euro)
Fuel (Gasoline)	3,170,000	3,170,000 *3.36 =10,651,200	7% * 10,651,200* 6.14 = 4,577,886 LC (1,190,250 Euro)
Total	18,788,100	63,128,016	25,479,401 ILS (6,624,644 Euro)

Expected funding resources:

- Total annual energy savings from the transportation sector is around 43,593 MWh amounting to around ILS 25,479,401 (EUR 6,624,644) of monetary savings.
- Budget: Estimated to cost EUR 8,000,000.
- Climate cost efficiency: If these measures are implemented by 2030, the expected abatement generated is 11,560 tCO₂-eq/a accounting for 127,160 tCO₂-eq until 2040. The climate cost efficiency is equal to the implementation cost divided by the abatement until 2040 according to the Paris Agreement.
- Source of finance: The municipality is the main implementor using funds either from the municipal budget or outsourcing to the national budget or grants. Smart mobility can be implemented through the participation of the private sector or investors. The municipality must enact the necessary legislation for the private sector to facilitate and support the action, noting that this can only be done in close cooperation and under the Governorate and concerned national authorities.

5.3.2 Municipal Transportation Solid Waste Sector

Background

The municipality collects and transfers solid waste using different types of garbage vehicles consuming significant diesel. The municipality collects solid waste and transports it to a populated area specific site, and often these wastes are disposed of through direct burning.

The municipality has a total population of 30,000 people annually producing solid waste of about 7,300 tons (20 tons daily), and is steadily increasing due to the continuously increasing population. The solid waste produced composition is 46% organic waste, and 54% other materials.

*Annual consumption x BAU coefficient (3.36 given by JRC)

Description of the Action

This action will be conducted in coordination and in complementarity with the Governorate's action and after assessment of the sector's capacity and plans to be modernized and upgraded.

1. Optimise fuel consumption for municipal solid waste collection through routing design and control.

The procedure will be based on the development of a GIS-based model, integrated to that of the nearby agglomerations, to calculate the fuel consumption of vehicles collecting municipal solid waste. The model will then be used to explore optimal conditions for waste collection in the city and to improve the efficiency of the waste management system, thus reducing the cost of waste collection resulting in environmental benefits.

First, the municipality should collect detailed data on the routes used in waste collection, the cost of operations and maintenance, the amount of waste collected, the number of garbage bins and their locations as well as details related to solid waste collection and transportation management (e.g., for example, what is incinerated and dumped in a landfill or recycled). This information will be used to assess the progress of work in the next stages when implementing measures related to better waste management.

Second, the municipality should equip collection vehicles with GPS, and use a GIS-based model to explore and test different collection scenarios and ensure effective solid waste management. The GPS-based Vehicle Tracking & Monitoring System (VTMS) will confirm in real-time the movement of vehicles and provide live compliance for vehicles using data feeds.

Third, IP cameras should be installed at landfill entries and exits and linked with the Integrated Weighbridge Vehicle Monitoring System (IWWMS).

Fourth, VTMS should be integrated with the control center in the municipal administration building and stakeholders should be trained on managing the entire ecosystem of the VTMS system.

Fifth, a GIS-based model should be developed to explore different scenarios to reach the optimal way to collect waste. This will include calculating fuel consumption and greenhouse gas emissions under current conditions and for scenarios explored without changing waste bin numbers or locations, investigating the adequacy of the number and positions of existing collection bins, conducting route improvement for the location of the proposed bins, implementing the new municipal solid waste collection plan, reviewing the results, and making an update necessary when needed.

2. Optimise fuel consumption for municipal solid waste collection by sorting at the source

Sorting at the source requires understanding the nature of people, preparing a long-term plan, creating the appropriate conditions, securing containers, conducting awareness campaigns, encouraging community participation with training courses, motivating work, and support from national authorities as well as past experiences in the same context with other municipalities.

General Objectives

To better manage urban waste by solving the daily challenges of planning, managing, and operating municipal solid waste programs and facilities, handling city waste in an environmentally acceptable way, raising public awareness of waste-related problems, incorporating good practices in the waste management systems, reducing emissions resulting from lower fuel consumption, reducing costs related to waste management, and creating new job opportunities for the local community.

Fuel Saving Calculation

Some municipalities have saved about 10% of their fuel by adjusting the routing, and up to 30% when sorting-at-the-source is adopted. Reducing collection to 3 times a week, returns from recycling materials, and creating jobs also leads to increasing conservation and environmental improvements.

Financial analysis

In the tables below, the calculations for energy savings are presented based on assumptions which can be verified and revised at the time of implementation.

ENERGY SAVING CALCULATION BASED ON ASSUMPTIONS WHICH CAN BE VERIFIED AT TIME OF IMPLEMENTATION

SITE CATEGORY	BAU the demand for energy (MWh) at 2040	BAU emissions tCO ₂ -eq at 2040	Estimated saving assumption, %	Calculated energy saving MWh/a	Calculated saving emissions tCO ₂ -eq
TRANSPORT SECTOR	625	167			
Routing design and control.			10%	62.5	16.7
Applying sorting from source			20%	125	33.4
Total			30%	187.5	50

Average Consumer Prices in Palestine for fuel (Gasoline) year 2019 equal to 6.14 (local currency) per litre and equal to 1.5964 euro per Litre.

*Emission factor for diesel 0.268 in (tCO₂-eq/MWh) *Emission factor for Gasoline 0.25 in (tCO₂-eq/MWh) *Conversion factor for diesel 0.010 in (MWh/L)

*Conversion factor for Gasoline 0.0092 in (MWh/L)

Source of energy	Consumption litre	BAU 2040	Annual monetary savings in local currency (LC) and in (Euro)
Fuel (Diesel)	18,600	18,600 * 3.36 = 62,496	30% * 62,496 * 5.69 = 106,681 ILS (27,737 Euro)

Expected funding resources:

- Total annual energy savings from the SWM transportation sector is around 187.5 MWh amounting to around ILS 106,681 (EUR 27,737) of monetary energy savings.
- Budget: Estimated to cost EUR 600,000.
- Climate cost efficiency: If these measures are implemented by 2030, the expected abatement generated is 50 tCO₂-eq/a accounting for 550 tCO₂-eq until 2040. The climate cost efficiency is equal to the implementation cost divided by the abatement until 2040 according to the Paris Agreement.
- Source of finance: The municipality is the main implementor using funds either from the municipal budget or outsourcing to the national budget or grants.

5.4 Solid Waste Management

Background

In 2019, solid waste generated in Palestine totalled about 1.59 million tons or nearly 4,356 tons per day (or 0.9 kg per day per capita). Most municipal waste (94%) is collected by municipalities, the UNRWA (in refugee camps especially), and the JSCs. The JSCs collect about 65% of the municipal waste with the remaining waste taken care of by the private sector. [5]

Regarding solid waste management legislation in Palestine, the main developments since 2016 have been the adoption of a new National Strategy for Solid Waste Management 2017-2022, the new Joint Service Council Bylaw (2016), the Solid Waste Management Bylaw (2018), and the Construction and Demolition Waste Bylaw (2019). These laws and regulations help clarify the different roles of the solid waste management stakeholders, however, enforcement of these laws and some specific guidance about standards of management, are still needed.

Disposal methods for solid waste in Palestine are mainly landfilling and dumping (random or controlled). About 30-35% of municipal waste is illegally dumped, and 65-70% is disposed of in one of the six operational landfills existing in Palestine. These landfills risk over-capacity in the short-term, due to land restrictions, low primary

[5] SOLID WASTE MANAGEMENT IN THE OCCUPIED PALESTINIAN TERRITORY West Bank including East Jerusalem & Gaza Strip Valérie Thöni & Samir K.I. Matar September 2019

separation, and an increasing trend in waste quantities. The use of solid waste transfer stations – places where solid waste is temporarily deposited and often separated to be later transferred to the final disposal site) is a relatively new approach in Palestine. There are currently 12 operational Palestinian transfer stations (11 in the West Bank; 1 in the Gaza Strip) and 3 newly constructed. These transfer stations have the potential for waste segregation and recycling activities, thus reducing waste disposed in landfills, however, their use is still underdeveloped.

The city of Idhna collects its solid waste through municipal garbage and participates in the Joint Council for Solid Waste Management in the Hebron governorate where the waste is transferred to the landfills at Al Minya. The municipality of Idhna has a total population of 30,000 people producing around 20 tons of solid waste daily. The solid waste produced is 46% organic waste and 54% other materials.

Converting organic waste to compost represents one of the solutions for 46% of waste in Idhna, where the composting is the process of controlled biological maturity under aerobic conditions, and the organic matter is decomposed to materials with shorter molecular chains more stable, hygienic, and finally beneficial for the agricultural crops and for recycling of soil organic matter.

The agricultural area cultivated in the city is about 10,000 dunams, most of it are olive trees, in addition to fruit, vegetables and mostly almond and fig trees and grapevines. Hence it is crucial to support the farmers through producing organic fertilizers from organic waste to be used by farmers instead of synthetic fertilizers.

The scrap sector is important in Idhna and neighbouring towns. Idhna represents the “capital” of scrap recycling in primitive ways yet still needs a lot of development and reform to get all the workshops to be facilitated, registered, certified, and taking optimal safety measures.

At the solid waste disposal sites (SWDS), the degradable organic carbon in waste is decomposed by bacteria under anaerobic conditions into methane (CH₄) and other compounds. The CH₄ emissions from SWDS are important contributors to global anthropogenic CH₄ emissions.

This report uses the IPCC default method of a simple mass balance calculation which estimates the amount of CH₄ emitted from the SWDS assuming that all CH₄ is released the same year in which the waste is disposed. The equation below calculates the landfill emissions and can also estimate emission reductions.

$$\text{Methane emissions (Gg/yr)} = (7.3 \text{ Gg} \times 0.8 \times 0.6 \times 0.1126 \times 0.77 \times 0.5 \times 16/12-0) \times (1-0)$$

$$\text{Methane emissions (Gg/yr)} = 0.202535872 \text{ Gg/yr}$$

Emission of methane in Gg/yr	Emission of methane t CO ₂ eq /yr	BAU year 2040 t CO ₂ eq /yr
0.202535872	0.202535872*1000*25= 5,063.4	5,063.4*3.36= 17,013.0

Description of the Action

This action will be conducted in coordination and in complementarity with the Governorate’s action and after assessment of the sector’s capacity and plans to be modernized and upgraded.

Waste management practices provide effective mitigation of GHG emissions. A wide range of mature, environmentally-effective technologies are available to mitigate emissions and provide public health, environmental protection, and sustainable development co-benefits. These technologies directly reduce GHG emissions through landfill gas recovery, improved landfill practices, and avoid significant GHG generation through controlled composting of organic waste and state-of-the-art incineration. In addition, waste minimization, recycling, and reuse represent an important and increasing potential for indirect reduction of GHG emissions by conserving raw materials, improving energy and resource efficiency, and avoiding fossil fuels.

Municipal solid waste management presents potential options for GHG reduction and has links to other sectors (e.g., energy, industrial processes, forestry, and transportation) with further GHG reduction opportunities. Solid waste management deals with the way resources are used as well as with end of life deposition of materials in waste stream, often complex decisions are made regarding ways to collect, recycle, transport, and dispose of municipal solid waste impacting cost and environmental releases.

At the outset, the municipality should reinforce the idea solid waste is one of the important local resources that must be preserved and invested in, and not disposed of in landfills. Involving the local community in the responsibility and giving it the role for better waste management will pave the way towards successfully implementing waste management and creating a new concept which is the preservation and investment of local resources. This action includes raising awareness of the importance of sorting-at-the-source and engaging the community, especially youth, who must be trained and given tools for implementation. The continuation of this awareness periodically will establish the commitment of the largest number of the population start sorting-at-the-source.

The municipality can study its options and develop a local strategic plan to manage the waste, taking into account the national plans and integration with neighboring towns

In all steps the municipality needs to prepare the ground for efficient management of solid waste and identify the methodology based on following but not limited to these indicative measures:

1. Waste reduction, reuse, and recycling through a solid waste sorting plant and sorting-at-the-source, in complementarity with the Governorate plans, namely covering neighboring agglomerations.

Recycling reduces GHG emissions through lower energy demand for production (avoiding fossil fuels) and by substituting recycled feedstocks for virgin materials. This is especially true for products resulting from energy-intensive production processes such as metals, glass, plastic, and paper. The magnitude of avoided GHG emissions benefits from recycling is highly dependent on the specific materials involved, the recovery rates for those materials, the local options for managing materials, and (for energy offsets) the specific fossil fuel avoided.

2. Biological treatment including composting, anaerobic digestion, and mechanical biological treatment.

Composting decomposes waste aerobically into CO₂, water, and a humic fraction. Some carbon storage also occurs in the residual compost. However, CH₄ and N₂O can both be formed during composting by poor management and the initiation of semiaerobic (N₂O) or anaerobic (CH₄) conditions. Thus it is important to plan the composting process to avoid increasing the emissions.

Depending on compost quality, there are many potential applications for compost in agriculture, horticulture, soil stabilization, and soil improvement (increased organic matter, higher water-holding capacity).

General Objectives

The main objective of solid waste management is to define a waste routing system assisted by a solid waste plan sorting-at-the-source, a sorting plant, and a composting plant. These could aid in minimizing solid waste methane emissions or avoiding contamination of ground water, decreasing the number of trucks and routes thus decreasing fuel consumption, reducing annual municipal costs, increasing municipal income, and benefiting from compost as an organic fertilizer that enhances soil and crop quality.

Financial analysis

Integrated strategies involving recycling and composting, play a significant role in reducing GHG emissions by recovering materials and energy from municipal solid waste.

In the tables below, the calculations for GHG emissions reduction are presented based on assumptions which can be verified and reviewed at the time of implementation:

REDUCTION OF GHG EMISSIONS WHICH CAN BE VERIFIED AT THE TIME OF IMPLEMENTATION

SITE CATEGORY	BAU emissions tCO ₂ -eq at 2040	Estimated mitigation assumption, %	Calculated mitigation emissions tCO ₂ -eq
Solid waste management	17,013	25%	4,253.3

The above estimated reduction in emissions will be based on SWM measures which will be applied and the actual cost will be known accordingly. It is important to verify the measures' cost and its feasibility based on climate cost.

Expected funding resources:

Source of finance: The municipality is the main implementor using funds either from the municipal budget or outsourcing to the national budget or grants. Solid waste management can be implemented through participation of the private sector or investors. The municipality must enact the necessary legislation for the private sector to facilitate and support the action starting with a feasibility study identifying the finance.

5.5 Local Energy Production

Background

In 2017, the city's electricity consumption was about 24 GWh. The demand for electricity will increase and may reach more than three times the current consumption by 2040 according to the business-as-usual scenario. Meanwhile, the city, like other Palestinian cities, suffers from a shortage of electricity due to the IEC, the main provider of the network, in addition to the annual increases in the energy bill.

Still, the city is located in an area rich in energy derived from the sun, with an annual sunshine of 3,000 hours and an average global horizontal radiation of 5.4 kWh/m²/day. The average production factor for PV systems is between 1,368 and 1,816 kWh/kWh per year.

Proposed sites for implementing a PV system in the cities are many (e.g., schools, hospitals).

Description of the Action

This action will be conducted in coordination and in complementarity with the Governorate's action and after assessment of the sector's capacity and plans to be modernized and upgraded.

The experiences in the use of renewable energy in Palestine are many and varied, and this helps in popularizing the use of renewable energy. Moreover, the investment in renewable energy requires high capital investment, experience as well as knowledge of the latest technologies. Where the municipality does not have the technical expertise and financial resources, the municipality can work with the private sector and enter into partnerships with investors who have successful experiences in implementing renewable energy projects and possess sufficient financial assets guaranteeing the implementation of long-term projects.

It is important here to pay attention to the need for a third party to ensure these projects' design, implementation, and operation. Hence, the importance of securing contracts that guarantee this work is not only for its implementation but also to ensure the sustainable operation and the efficiency of the desired results from this project. Thus, the investor guarantees the economic return on his investment, and the municipality guarantees the sustainable operation of the project.

It is important here to pay attention to the need for there to be a third party to ensure the design, implementation, and operation of these projects. Hence, the importance of securing contracts that guarantee this work is not only for its implementation, but also to ensure sustainable operation and the efficiency of the desired results from this project. Thus, the investor guarantees the economic return on his investment and the municipality guarantees the sustainable operation of the project.

Below is the suggested list of projects the municipality should implement:

- Use online grids for municipal buildings with a connected PV system varying in size based on their average daily consumption. Such projects in municipal buildings are important even if they are small in size as they develop confidence in the use of renewable energy and give practical experience to individuals working in the municipality and make them talk about the success of the project with others and help in understanding the new technologies. The payback period for the investment in grid-connected photovoltaic systems ranges from 4 to 7 years and is considered a good investment.
- Promote the use of online grids for households and tertiary customers with a connected PV system of 5 kWp based on their average daily consumption.
- Upon regional coordination with the governorate a PV solar farm could be created in the city to secure the electricity stability and reduce dependence on fossil fuel. A PV farm project should be coordinated with national authorities and IEC to secure the stability of the grid during the daytime and guarantee the return on investment. A long-term EPC should be applied along with third party role to monitor the performance and guarantee the long term of operation and protect the interests of both the municipality and the investors.

The costs and benefits of the green energy program are summarized in the table below:

SOLAR PV ANNUAL ELECTRICITY PRODUCTION (MWh)

Site Category	System type	Annual Production (MWh)	CO2 emissions saving in tCO2-eq	Project cost In Euro
PV system on municipal building	9 x 30KWp	270 KWp x 5.3 Average operation hours per day x 365 days / 1000 to convert to MWh =522.3 MWh	522.3 * 0.720 = 376.1	364,500
Rooftop PVs in residential and tertiary buildings	2,000 x 5 KWP	10,000 x 5.3 x 365 / 1000= 19,345 MWh	19,345 * 0.720 = 13,928.4	13,500,000
Solar PV Farm	3 MW	3 MWp x 5.3 Average operation hours per day x 365 days =5,803.5 MWh	5,803.5 * 0.720 = 4,178.5	4,050,000
Total		25,670.8 MWh	18,483.0	17,914,500

Financial analysis

Source of energy	Production of green energy MWh per annum	Annual green energy produced local currency (LC) and in (Euro)
Renewable Energy	25,670.8	600 * 25,670.8 = 15,402,480 (Euro 4,004,805)

The return on investment is estimated to be EUR 4,004,805 per year.

Expected funding resources:

- Total annual energy savings is around 25,670.8 MWh amounting to around ILS 15,402,480 (Euro 4,004,805) of monetary earnings.
- Climate cost efficiency: If these measures are implemented by 2030, the expected abatement generated is 18,483 tCO2-eq/a accounting for 203,313 tCO2-eq until 2040. The climate cost efficiency is equal to the implementation cost divided by the abatement until 2040 according to the Paris Agreement.
- Source of finance: The municipality can build long-term partnerships with the private sector.

6

Adaptation Actions

Chapter 6: Adaptation Actions

6.1 Population & Public Health

Extreme heat events can be dangerous to health – even fatal. These events result in increased hospital admissions for heat-related illnesses as well as cardiovascular and respiratory disorders.

- Extreme heat events can trigger a variety of heat stress conditions, such as heat stroke. Heat stroke is the most serious heat-related disorder. It occurs when the body becomes unable to control its temperature. Body temperature rises rapidly, the sweating mechanism fails, and the body cannot cool down. This condition can cause death or permanent disability if emergency treatment is not given. Small children, the elderly, and certain other groups including people with chronic diseases, low-income populations, and outdoor workers have higher risk for heat-related illness.
- Higher temperatures and respiratory problems are also linked. One reason is because higher temperatures contribute to the build-up of harmful air pollutants.
- One of the most important effects of climate change in Palestine is the shortage of water. One of the adaptation measures to cope with water shortage includes reuse of grey or treated wastewater in irrigation of trees or vegetables. This could increase the opportunity for transmission risk of several pathogens through crop contamination leading to outbreaks like typhoid or hepatitis if the water is not treated.
- Rising temperatures due to climate change increase microorganism growth leading to increases in water- and food-borne diseases. In contrast, flooding as a result of extreme rainfall concentrating annual rainfall in a small interval disrupts water purification with contamination from sewage disposal systems leading to increased probability of epidemics due to vector borne water- and food-borne diseases.
- Climate change may also influence the seasonal pattern for respiratory diseases, cardiovascular diseases, and mortality. The most visible effect of climate change on respiratory diseases is on chronic respiratory diseases including bronchial asthma and chronic obstructive pulmonary diseases. Acute infectious respiratory diseases seem not to be directly impacted.
- Impacts on the health sector range from insignificant (malnutrition) to catastrophic emerging epidemics (haemorrhagic fevers). Young children and elderly are the most sensitive group mainly to food- and water-borne diseases where admission rates will increase followed by respiratory diseases resulting in increased mortality rates.
- Increased temperatures from climate change will increase the frequency of days with unhealthy levels of ground-level ozone, which is a harmful air pollutant and a component in smog resulting in damaging lung tissue which reduce lung functioning and results in premature deaths.

Main adaptation measures suggested at the national level:

In coordination with national and regional related action:

- Establish an early warning system.
- Adopt healthy buildings using building guidelines which include instructions for advanced sanitary installation that separate grey water from black water.
- Sustain and improve sanitary conditions.

The following table explains the adaptation actions related to population and public health:

Action Type	Adaptation
Strategic	Develop a health action plan for extreme events the municipality is facing (e.g., extreme heat)
	Provide access to air-conditioned public buildings during heat waves or other extreme events for citizens lacking protective infrastructure (e.g., people living in underground apartments lacking AC during extreme temperatures)
	Update building codes and landscaping laws to increase energy efficiency and improve the ability of buildings to provide protection against extreme heat events (e.g., green roofs and strategically located shade trees)
	Reorganize working hours and reschedule the working time to avoid mid-day work
	Collaborate with regional medical services to increase preparedness level

* National report MOE & UNDP TNC

Action Type	Adaptation
Alerts & Communication	Develop an early warning system to alert citizens of extreme weather events or natural disasters (e.g., heat waves, floods)
Educational	Conduct educational and awareness campaigns about health-related effects of heat waves, vector-borne diseases, etc. while informing residents on ways to protect their health and prevent infection or impact (see Guidelines in Chapter 7 of this SEACAP)
	Provide instruction for public on staying hydrated and avoiding strenuous outdoor exercise during heat alerts
	Provide easy access to public drinking fountains, swimming pools, and spray pads, also take preventive action like opening cooling centres where the public can gather for relief from the heat
Technical	Clean and maintain sewage and drainage systems
	Identify potential hot spots for the development of vector borne diseases
	Cultivate urban forests, including street and wooded areas
	Monitor frequently water and air quality

6.2 Infrastructure

Climate change has the potential to impact the safety of existing structures, increase the frequency of weather-related disasters, increase premature weathering regionally, and change significantly design criteria and engineering of structures. Because infrastructure built in current times is intended to survive for decades to come, it is critically important adaptation options for climate change be developed today, incorporated into design, and implemented as soon as possible. Prioritization of required adaptation actions will need to account for existing and future vulnerabilities, the variable lifecycles of structures and replacement, and maintenance cycles.

“No regrets” types of adaptation actions available today need to be applied as soon as possible in complementarity with national and regional actions. These may include measures to reduce uncertainties in climatic design values, regularly updated climatic design values, enforcement of codes and standards, maintenance of climate data records and networks, consistent forensic analyses of infrastructure failures, regular maintenance scheduling, and community disaster management planning. However, given the potential changes expected, it is also likely that many impacts on communities and infrastructure will lie outside of the coping ranges of infrastructure. When this occurs, engineering and planning practices will need account for these growing uncertainties while new adaptation options are developed over time.[7]

Water Resources:

The main climate hazards the water sector faces in Palestine are increased temperatures, decreased precipitation, increased incidents of drought, and increased evaporation. Climate impacts on the water sector include reduced groundwater recharge, deteriorating groundwater quality, reduced stream flow, and increased water demand.

Adaptation strategies and measures suggested for the water sector in complementary with the national and regional levels are:

- Rainwater harvesting, where quantitatively justified and feasible.
- Wastewater treatment
- Increasing efficiency of irrigation technologies
- Grey water reuse
- Public awareness
- Flood water retention

The following table explains the adaptation actions related to the water sector:

Action Type	Adaptation
Strategic	Develop a water and wastewater management plan
	Model predicted supply changes in the electricity from locally available resources
	Monitor frequently infrastructure to spot and quickly repair any damages

Action Type	Adaptation
	Reduce uncertainties in climatic design values, regularly updated climatic design values, enforcement of codes and standards, maintenance of climate data records and networks, consistent forensic analyses of infrastructure failures, regular maintenance scheduling, and community disaster management planning.
Alerts & Communication	Issue alerts when infrastructure has been severely damaged and should be avoided
Educational	Develop guides and awareness campaigns saving water and energy, especially during crisis
Technical	Integrate sustainable drainage systems
	Establish underground water reservoirs
	Cultivate green roofs on top of impermeable surfaces to deal with rainwater storage and heat
	Rehabilitate springs
	Increase use of renewable energy to decrease pressure on the public grid and contribute to ameliorating power plant failures
	Develop flood management zones and harvest flood waters
	Use advance tap water such as the aerator tap to regulate water flow
	Improve efficiency of water storage systems to reduce evaporation
Collect rainwater through building roofs for household usage	

6.3 Built Environment

Adaptation actions improve the resilience of the built environment in the face of climate change and also protects the wellbeing of communities through targeted policy initiatives and better urban and building design, ensures appropriate institutional arrangements facilitating adaptation, realises economic benefits from early adaptation through effective strategic planning and risk minimization, advances sustainability through better resource and risk management strategies, and increases community education and awareness about climate change risks and adaptation.

Urban Sector:

Adaptation measures suggested for the urban sector in complementarity with national and regional levels are:

- Introduce climate responsive building techniques and elements to reduce the effect of heat and reduce demand on energy for cooling;
- Promote the use of energy saving devices, and raise awareness on the long-term benefits of energy efficiency and saving devices;
- Amend sector policies and regulations, such as building codes, to reflect climate change risks and direct people towards insulating buildings to reduce energy demand;
- Construct proper storm water network to discharge storm water from built environment;
- Adjust zoning and development regulations to address vulnerability of specific locations and/or resources.

The following table explains the adaptation actions related to the urban sector:

Action Type	Adaptation
Strategic	Modify building codes allowing more energy efficient and heat tolerant structures
	Modify building codes against seismic activity
	Reduce municipal taxes for adopting adaptation measures for their houses
Alerts & Communication	Not applicable
Educational	Conduct educational campaigns informing citizens on the benefits of adopting the suggested actions
Technical	Build greening infrastructure such as buildings' roofs and walls
	Increase the amount of shade and green areas in the city by planting trees to reduce the heat island effect

Action Type	Adaptation
Technical	Build exemplary districts with adapted urban forms and buildings
	Paint roofs white (or other cooling colours) and introduce shading and bioclimatic design
	Collect rainwater while adopting methods to reduce water demand
	Use water resistant construction materials
	Update sewage system by separating grey and black water while benefitting from recycling grey water with several household applications
	Adopt flood resistance techniques applied on buildings, such as building elevation or wet flood proofing

6.4 Economy

Socio-economic Analysis:

The study used an income assessment as the main critical indicator to the sensitivity of local community to the climate change. The importance of these indicators are linked to the impacts of climate change on agricultural productivity at the study site. Notably, 54.47% of the community income is based on agriculture making it the most sensitive sector to climate change.

Further measures are required to explore the linkages between socio-economic studies and climate change impacts to enhance the adaptive capacity in communities.

Such measures include:

- Increasing women's skill-development and capacity building opportunities through training in community and political participation skills and link them to general literacy and education initiatives.
- Taking measures to increase the labour productivity of rural women through improved access to training, extension services, and technology.
- Prioritizing by national governments of inclusive economic growth which does not exclude the rural poor.
- Mainstreaming the role of media in climate change and supporting NGOs and community-based organizations well placed to spearhead awareness efforts in different community segments, and in their climate change media-targeting activities.
- Conducting a pilot study on vulnerability to food security due to climate change using a multilevel approach including an analytical and relatively comprehensive chain of logical events regarding the impacts of climate change for farm households is needed.

6.5 Society

6.5.1 Women empowerment project (Home Licensing)

Background

In 2019, Idhna's population of 30,000 was 49% female with unemployment at 25% compounding issues of a high poverty rate and a low average annual household income.

The municipality has the authority to grant home licenses to practice a profession at home in order to achieve self-sufficiency to anyone who cannot open a shop or license a facility. There are also persons with special cases depriving them from leaving their homes who can be trained on any profession they can do from home.

Description of the Action

- Give home licenses through professional licensing
- Support women's small projects providing an income for them and their families by purchasing products, machinery, or any other requirements of a productive project.

The project implementation steps are as follows:

- Prepare a feasibility study
- Identify work phases for different project components
- Provide funding
- Prepare a market need plan and the need of women from supplies and equipment
- Prepare different tenders to purchase needed equipment

General Objectives

Assist women and enable them at homes, create a source of income for poor families, activate the economy, monitor and supervise home professions. Create a source of revenue for women's families, legalize their work, increase women's economic participation at the local level, monitor the market and its production from a health perspective.

6.5.2 Business Development Centre

Background

The town of Idhna is located in the Hebron Governorate. The town is highly populated and has an area of 30,000 dunams. The unemployment rate is more than 25%, especially among graduates of universities and institutes. About 31% of the population are economically active of whom 74.6% were employed and the remaining 25.4% either unemployed or have never worked.

There must be a pioneering idea contributing to providing job opportunities and developing small economic facilities, enabling women and activating the role of youth.

Description of the Action

Establish a business development centre to assist the local community in getting guidance, support, and employment for workers, marginalized groups, and persons with experience but needing assistance, in addition to enabling women and assisting them with licensing and other requirements.

The project implementation steps include:

- Prepare a feasibility study
- Identify work phases for different project components
- Provide funding
- Identify partners from the private sector
- Prepare different tenders
- Execute the project
- Operate and maintain the centre

General Objectives

The centre is considered a pioneering idea and the first of its kind in the municipality as it will be concerned with development, qualifications, and employment. There is a need to find a permanent location for the centre to revitalize businesses, alleviate poverty and unemployment, educate and assist the community.

Reducing unemployment, enhancing the local economy, and satisfying the community contributes to sustainable development.

6.6 Water: Modern Water Harvesting System

Background

Surface water harvesting is the technique of gathering or accumulating and storing rainwater, and it provides drinking water, domestic water, water for livestock, water for irrigation, and a way to increase groundwater levels.

The water network was originally provided in 1974 by Israeli water company Mecorot during the occupation of West Bank. Currently, municipal officials estimate that 95% of housing units have access to the water network. People are relying on alternative water sources such as the two artesian wells existing in the town in addition to some springs, but the water is becoming increasingly polluted.

The irrigation water is supplied from the water network as well as from the existing artesian wells and springs. This insufficient quantity of water is utilized for agriculture forcing farmers to buy water from private sources.

Description of the Action

To meet multiple water demands, and to reduce the water shortage for residents and farmers, the municipality is establishing a multi-purpose water harvesting system including the construction of new water reservoirs or ponds in farms, urban areas, streams, and valleys.

The project development and implementation steps are:

- Determine the location of the ponds or of the concrete reservoirs
- Draft study plans with specialized engineers
- Construct the water reservoirs or ponds as per plans
- Construct a water distribution system to deliver the water to its proposed destinations
- Equip the water harvesting system with PV cells to solar power the new pumping system

General Objectives

Collecting rainwater from natural seasonal streams during winter and spring season is important to secure a strategic amount of water needed for agriculture while reducing the use of ground water for a certain period of time.

The main objectives of the project are:

- Creating a water run-off harvesting system
- Saving the underground water tables from depletion, and ameliorating water quality
- Supplying water for domestic service use, public green spaces, farms, and flocks
- Preventing over pumping of the aquifers
- Maintaining crop levels
- Maintaining livestock level in the city by providing drinkable water
- Controlling seasonal floods
- Expanding tourism by increasing the green areas related to tourism
- Providing a model for nationwide application
- Increasing green areas reducing air pollution, CO2 quantities, and dust levels
- Raising awareness among citizens and tourists regarding water harvesting to counter expected droughts

6.7 Livestock

Background

Globally, recent increases in livestock productivity have been driven mostly by animal science and technology. Scientific and technological developments in breeding, nutrition, and animal health will continue to contribute to increasing production and further efficiencies and genetic gains. Demand for livestock products in the future, particularly in developing countries, could be heavily moderated by socio-economic factors such as human health concerns and changing socio-cultural values.

To date, there is no designated industrial area for hosting livestock related activities, so livestock farms are scattered among houses and buildings.

Description of the Action

Livestock production is an important livelihood for the farmers in the region. It is a source of food and food products as well as a source of income. However, livestock productivity in the region is below their genetic potential – mainly because of inadequate nutrition, poor reproductive management, and animal diseases.

The municipality wants to establish a livestock development strategy based on modern livestock science and technology as a driver for change.

The livestock development strategy aims to:

- Improve genetic development and develop a ruminants care program including:
 - Improving the genetic efficiency of sheep and goat wealth
 - Using modern technologies for genetic assessment and breeding
 - Improving production systems
 - Building capacity for farmers in livestock breeding and caring
- Develop feed and feed resource programs including:
 - Researching use for tree residues (dates, palm, olive, etc.) in animal feeding
 - Establishing small units for the manufacture of agricultural residues and residues of food industries and distribute it to small farmers to benefit from them
 - Training courses for technical cadres on modern technologies to optimize agricultural residues and food industry residues in feeding animals
 - Surveying traditional and non-traditional food resources in the municipality and its surroundings
- Improve animal health systems and reduce the impact of animal diseases on animal production and public health through:
 - Strengthening veterinary governance, animal health systems, and service delivery
 - Improving and promoting veterinary trainings
 - Strengthening data systems and animal health information
 - Eliminating gradually animal diseases
- Promote innovation, generating and utilizing technologies, capabilities, and skills
- Establish a modern slaughterhouse
- Establish a dairy factory
- Establish a poultry farm
- Establish an animal manure treatment plant

General Objectives

Livestock is a major contributor to rural development around the municipality. Producing food and enhancing crop production provides additional economic goods and services as well as cash income. The development of livestock diversifies and increases total farm production and income, provides year-round employment, and disperses risks. Sales of livestock enhance the economic viability and sustainability of a farming system.

6.8 Agriculture, Forestry, & Other Land Use (AFOLU)

Agriculture Sector:

Idhna's wide range of agriculture lands are impacted by increased temperatures and drought resulting in decreased agricultural production. In addition, many citizens rely on burning material for energy which releases millions of toxins. Plus, burning caoutchouc to extract copper has also resulted in burning some agricultural lands as well.

Several steps will strengthen the agricultural sector and contributes to its sustainability, such as ceasing urban encroachment on lands and their reclamation for agriculture, using wastewater and grey water in crop irrigation, and encouraging intensive agriculture and specialization. Additionally, collecting rainwater could be used in irrigation techniques during summer while decreasing the consumption of ground water for agriculture.

The **major climate exposure risks** associated with agriculture in the municipality have been identified as:

1. Temperature increase
2. Rainfall decrease
3. Droughts
4. Rainy season shifts
5. Floods

The **major sectors of high climate sensitivities** are:

1. Cropping systems
2. Livestock production
3. Livelihood and food security

The key adaptation measure to climate change is **setting and implementing a sustainable agriculture policy in concert with national and regional authorities.**

Adaptation measures vary horizontally according to the agricultural subsectors and their vulnerability to climate change. These measures vary vertically according to the different actors involved in the development and implementation of this policy.

The adaptation strategies to a changing climate include:

- Agronomic and crop strategies intended to offset either partially or completely the loss of productivity caused by climate change by applying protection through different temporal scales (e.g., short-term adjustments and long-term adaptations), and spatial scales (e.g., farm, regional, or national level adaptation)
- Socio-economic strategies meeting agricultural costs of climate change

Generally, the most important adaptation measures in agriculture are:

- Modifying cropping patterns
- Modifying crop calendar including planting and harvesting dates
- Implementing supplemental irrigation and water harvesting techniques
- Improving water use efficiency
- Using different crops varieties
- Modifying policies and implementing action plans

Most of the **interventions to upgrade rain-fed agriculture** can be cost-effective in farming systems, especially where irrigated agriculture is not feasible. For example, supplemental irrigation (the watering of rain fed crops with small amounts when rainfall fails to provide sufficient moisture) has proven to be a drought-proof strategy in most areas.

Increased water available for supplementary irrigation can be achieved through **on-farm rainwater harvesting and management system**, i.e., small farm ponds for micro-irrigation using drip or sprinkler irrigation systems. Larger rainwater storage structures can also be constructed to provide supplementary irrigation water to a number of small farms or fields by using the micro-dams.

Conservation agriculture, on the other hand is very efficient, leading to increased crop yield. In this adaptation measure, several techniques are used to enhance soil water storage. Water conservation is usually enhanced through mulching and crop residue retention through zero or minimum tillage, stubble mulch tillage, strip tillage, and crop rotation. Conservation agriculture, however, requires extension programs such as training and providing equipment.

The following table explains the adaptation actions related to agriculture:

Action Type	Adaptation
Strategic	Elaborate a drought, water, and ground water management plan
	Assess agriculture land for soil quality
	Adopt integrated land use planning for tourism
Alerts & Communication	Prepare a protective system for any fire hazard
	Improve forecasting and become familiar with forecasting information available via the media and on internet-weather radar and lightning detectors
Educational	Educate farmers and tourism personnel on conserving natural resources, especially during extreme weather events
	Adopt awareness sessions agricultural sustainability, and encourage the participation of youth and young farmers and their integration with the old farmers to benefit from their experiences
Technical	Use drought resistant crops
	Adopt agroforestry systems
	Use drip irrigation practices
	Adopt energy efficient and water conservation programs at resorts
	Reduce cooling needs in resorts (if any) by installing automations and setting thermostats at given temperatures
	Promote renewable energy sources in resorts
	Adopt the fertigation technique (dripping chemical and/or organic fertilizers with water)
	Adopt Groasis Waterboxx tech to minimize water and improve plant growth
	Conserve organic agriculture by combining zero or low tillage with permanent soil cover
Protect forests and prevent overgrazing	

Additional Actions for the Agriculture Sector

Study the modernization of agricultural production, practices, and tools; enhance the quality of agricultural fertilizers and pesticides; and improve the marketing of agricultural products through the following measures and actions:

- Conduct feasibility studies on potential new crops.
- Include financing and developing alternative crops suitable to the region.
- Establish an agricultural equipment cooperative providing modern equipment suitable to the characteristics of the land and the cultivated crops.
- Establish an agricultural observatory to conduct soil analysis and measure humidity and other weather indicators affecting production, and select optimal crops and the best fertilizers as well as their optimal amounts and the timing of their application.
- Follow up on the wastewater treatment plant project to produce and provide agricultural fertilizers at competitive prices.
- Encourage local authorities and agricultural cooperatives to establish packaging and cooling centres in the most prominent fruit production zones responsive to farmers' needs.
- Establish firms specializing in labelling and exports.
- Conduct studies on the exploitation of the arable lands.
- Organize awareness campaigns on the techniques of using fertilizers and pesticides.
- Organize marketing campaigns for the crops.
- Establish composting projects to aerobically compost unused biomass from agriculture such as harvest residuals, fruit-food waste, pruning material, and manure.
- Launch a field agricultural school to build the capacity of farmers.

- Introduce agroforestry to manage and integrate trees, crops, and livestock and control run-off and soil erosion, reduce water loss, soil material, and organic nutrients.
- Improve water quality and management, protect natural water resources, reduce water losses, and establish water harvesting systems.
- Install new irrigation techniques reducing water consumption.
- Improve water quality and management, protect natural water resources, reduce water losses, and establish water harvesting systems.
- Install new irrigation techniques to reduce the water consumption.

6.9 City Greening

Background

Idhna is facing long drought seasons due to scarcity of water and high summer temperatures. The municipality covers over 30,000 dunams with few green areas in the municipality territories. A hot climate in summer makes life uncomfortable for town residents. Hence, it is very crucial to green the urban area in the town, protecting the citizens from the direct sunlight, and enhancing a clean healthy environment.

Description of the Action

The municipality aims to green itself by planting trees in streets, around buildings, and in unused lands to improve the public health statement, urban beauty, and to connect the community to the green environment by encouraging residents to plant trees around their houses by linking new building permits to the availability of a green space. The municipality is preparing a master plan for city greening including, but not limited to, the following steps:

- Mapping the points and areas to be planted with trees
- Selecting trees adaptable to local climate (minimal water required in summer and unlikely to pose preservation problems)
- Creating a tree census (location, species, size, number, and condition)
- Studying the possibility to plant trees in the soil or in Groasis Waterboxx
- Financing program elaboration
- Acquiring plant stock
- Planting program in collaboration with specialized institutions and experts
- Deploying proper irrigation systems using new technologies like water dripping systems
- Conserving trees through proper irrigation and protection

The project consists of planting 5,000 trees throughout the city in 5 phases over 5 years (1,000 trees per year). An average tree absorbs 43.6 kg of CO₂ per year meaning the project will absorb 218,000 kg annually.

General Objectives

Planting trees and green spaces are associated with better air quality, reduced traffic noise, cooler temperatures, and greater diversity. Trees:

- Improve emotional and psychological health
- Beautify the environment
- Provide shade, keep the earth cool, and reduce cooling costs
- Reduce greenhouse gases by capturing carbon dioxide during growth
- Improve air and water quality by absorbing air pollutants like ozone and nitrogen oxides while intercepting particulates like dust and smoke
- Reduce energy consumption and cool the atmosphere
- Decrease topsoil erosion
- Increase economic stability
- Conserve soil carbon while storing more carbon in the soil
- Reduce storm water runoff
- Foster a safer and more sociable neighbourhood environment

6.10 Public Learning Garden

Background

Public gardens are in the forefront of organizations committed to promoting the conservation of plants and their habitats, developing sustainable environmental management practices, and providing green spaces where residents can reconnect with the natural world.

Description of the Action

The municipality aims to establish public gardens with multipurposes including awareness raising for climate change as well as social activities, sports, and pilot projects.

The project development and implementation steps are:

- Choose the garden site
- Assess the proposed site (size, neighbourhood, landowners, soils, water availability, etc.)
- Select the garden type and mode for a public garden composed of three areas:
 - Climate change demonstration area
 - Experiment with new species, planting, and harvesting dates, manage water, protect plants against frost, be aware of any new threats, reduce and replace nitrogen fertilisers, plant strategically, etc.
 - Biking and hiking area
 - Construct biking and hiking paths and walkways for the local community and visitors
 - Pilot projects related to mitigation and adaptation to climate change
 - Organic matter composting, crop residues mixed with animal manure, organic waste composting
 - Solid waste sorting-at-the-source, separation of plastics, cartons, glass, organic matters, hazardous materials
 - Aquaponics combining aquaculture (raising fish) and hydroponics (soil-less growing of plants)
 - Solar PV cells to luminating the garden and for water pumping
 - Water management through water harvesting rainwater tanks
 - Sustainability using recycled and local materials and growing a variety of plants for biodiversity
 - New irrigation technologies
- Create your management plan and garden layout
 - Design garden involving a professional landscape architect to lead the discussion in meetings and ensure all ideas are heard and the resulting plan will be something all can own
 - Apply and receive approval for funding by developing a budget and considering potential financial resources like sponsorship by local businesses of a section of the garden, grants from the city or other bodies, donations from local businesses for materials, plants, trees
 - Construct garden and develop garden group, grow plants and trees, install water tanks and pumps, construct biking pathways, construct hiking paths, etc.
 - Install signage to educate community on energy consumption awareness raising, efficient water usage, renewable energy use, solid waste sorting, etc.
 - Provide guided tours for school children and other groups
 - Establish pilot projects
 - Promote the garden through the municipality website, media releases, publications, and events
 - Monitor and maintain the garden

General Objectives

Public gardens are a unique form of open space managed by the municipality to encourage a healthier lifestyle within the local community and to contribute to a sustainable urban environment. They are the place to learn about climate change and can be used to understand the global impacts of a changing climate. Public gardens have a lot of benefits such as:

- Place for physical activities, provide hiking and biking trails and other amenities designed to get people active
- Place for kids to be outside, being outside and playing in nature is crucial for the healthy development of children
- Mental health boost, a place where people are able to make connections, meet new friends, and participate in recreational activities, in addition to physical activities

- Centre of community, provide space for neighbourhood residents to interact with each other and meet new people
- Storm water collection, trees and grass are a far more efficient and less expensive method of managing storm water than sewers and drainage ditches made of concrete
- Clean air and reduced CO2 emissions, trees and plants remove pollutants from the air and eat CO2 during growth
- Create job opportunities for the local community

7

Communication

Chapter 7: Communication

I - Background

Climate Change is one of the greatest threats facing humanity. A recent report from the Intergovernmental Panel on Climate Change (IPCC) on global warming identifies the southern Mediterranean region (including the Maghreb and Mashreq countries) as a climate change hotspot. The region is increasingly subject to the numerous effects of climate change such as increasing water scarcity, droughts, agricultural and food risks, rising temperatures, and growing rates of desertification. Among the common challenges Mediterranean cities face are changing behaviour, building climate awareness, and accessing complex and sometimes inaccessible scientific climate change information as public awareness and social engagement is pivotal. Achieving them requires breaking psychological barriers so specific measures can be applied to change behaviour and provide education.

Awareness about the important link between environment and development in the Mediterranean is increasing.[1] Existing authorities have the capacity and means to inspire, motivate, and engage citizens in global challenges and good practices towards sustainable development by promoting and supporting relevant initiatives in different fields and integrating policies to increase public awareness. Thus, they can become drivers for change as natural leaders of awareness-raising at the local level.

Additionally, young people - who constitute the largest segment of the MENA population - are becoming involved in climate change through new information technology.[2] They are more than ever much more likely to believe climate change will have a severe negative impact. More effective education and awareness is one way to provide them with more effective ways to take action on climate issues.

As hundreds of cities are developing and launching their Sustainable Energy Access and Climate Action Plans (SEACAPs), they undeniably need to build impactful and compelling communication strategies and awareness actions. This chapter guides local authorities and cities in communicating their SEACAPs with a step-by-step action plan and strategy, planning guidelines, communication tools, modes, methods, and channels. It also includes guiding principles to set up the vision of the cities, survey templates, and examples of sector-specific awareness actions to implement awareness-raising campaigns successfully.

[2] <https://www.arabnews.com/node/1564706/middle-east>

II- Developing a Communication and Awareness Plan (CAP)

The Communication and Awareness Plan (CAP) is a pillar of a SEACAP. The CAP serves as a practical, action-oriented guide to cities developing systematic and effective approaches to communicating support for their local SEACAP and its related projects.

In the long run, developing a successful CAP and maintaining it can be a significant challenge as it can encounter inertia or active opposition, particularly from audiences who are climate sceptics, as well as due to a lack of staff, skills, and budget.

Providing information and raising public awareness is therefore vital for inspiring voluntary changes in behaviour, generating stakeholder support for local authorities' policies, and addressing the arguments of those who oppose specific actions.

The CAP is an essential measure that should be feasible, efficient, and adapted to local needs and cultural contexts. It is based on the following six steps:

Step 1: Set the city's vision

When committing to developing a SEACAP, the municipality must have a vision of what needs to be achieved to engage partners and stakeholders, connect with citizens, plus design and execute the awareness campaign.

The vision will define the identity and uniqueness of a city and its communities and imagines what it will look like decades from now. It should be structured around storytelling and a slogan as a "concept idea" reflecting the city's values.

To achieve the new vision for the city, developing the communication and awareness plan and goals should include broad public involvement, community consultation, and engaging community members on issues affecting them.

Figure 6: Examples of vision slogans from SEACAP cities

See Annex 1 for guidelines on developing a city's vision.

Step 2: Identify priority actions and measures

During the development of a SEACAP, cities identify and validate several priority adaptation and mitigation projects in the relevant sectors including energy, transport, waste management, water management, agriculture, public lighting, etc. They need to communicate these projects effectively by launching a customised range of communication actions and products from brochures, radio programmes, and social media outreach by elaborating on educational curricula for secondary schools, publishing training manuals for technical staff, etc., that will be adapted to each one of them. Some of these activities will require significant investments and ambitious campaigns. In contrast, others can be successfully carried out in collaboration with local NGOs and associations within existing capacities and with minimum funding.

A clear strategy with understandable actions includes inspiring messages related to concrete and achievable action plans establishing a sustainable and long-term climate awareness programme.

Step 3: Conduct a local needs assessment

Awareness-raising actions and campaigns are most likely to succeed if developed in cooperation with local stakeholders and citizens with various roles throughout the local economy. Their views and insights about climate change as well as environmental and energy issues may differ from or possibly complement those of the municipality. As potential partners, they can play a key role in implementing and supporting the local outreach programme.

Observing audiences' behaviours, perceptions, and socio-demographic characteristics is the best way to anticipate barriers impacting their choices and preferences. It is essential to (1) identify target audiences and dig deeper into their true motivations (possibly rooted in cultural norms and beliefs) and present the message to reflect them; and (2) identify the situation, goals, drivers, and challenges while being clear about precisely what behaviour we want to change.

For this reason, a questionnaire survey must be developed and used to:

- Test the audience's opinions and capabilities for exploring climate change priorities, awareness levels, perceptions, social/peer groups influence as well as assess existing resources for communicators, socio-cultural influences, and environmental practices.
- Help define a few population characteristics regarding age, urban environment, degree of education, employment, family situation and income, receptiveness and level of awareness, willingness to change behaviour. This will allow the communicators to gather the resources responding to those specific situations.
- Identify current attitudes to environmental issues, barriers to action (possibly including cost; "not my problem as an individual"-attitudes; performance and effort expectancy; absence of facilitating conditions; lack of information; etc.).
- Guide the awareness-raising strategy, messaging, and materials to be developed and communication channels used to convey the information.

See Annex 2 for a sample questionnaire adaptable to specific local needs.

Step 4: Analyse the risks, challenges, and opportunities

When promoting an action, it is likely needed to communicate both the consequences and solutions it will generate. As a follow-up to the survey, it is necessary to review and validate the needs assessment findings, agree on a list of priority activities to be conducted, bring recommendations on how to implement these activities, and allocate necessary resources. Then, produce a coordinated strategy and action plan to establish a long-term well-balanced climate awareness programme in communicating local impacts of climate change so citizens could grasp what this issue may mean for their well-being and how they can join forces to fight it.

It is important to:

1. Review some existing or previous actions and the issues that may have negatively impacted the success of the communication. A SWOT analysis may help identify potential threats or risks for that purpose;
2. Draft a list of tools through which the audience should be reached; and
3. Draw an action plan to implement key actions.

On the other hand, the driving factors may involve those drawn from social networks and influencers' support. Therefore, to be better received, an awareness campaign should focus on the audience's needs, address the whole community, and empower them with knowledge.

Some identified barriers to change include economics; differing management views; insufficient, inadequate, or conflicting information; doubts over likely success; age and/or health of the individual; lack of government incentives; lack of time; and lack of financial resources.

Step 5: Design the Strategy

The communication strategy seeks to answer the following questions:

- Who are the stakeholders with whom the local authorities need to engage?
- What changes in opinions or behaviour do we seek?
- What messages should be used?
- What communication channels will be most efficient?
- How are the communications-related responsibilities shared among the different actors?
- What are the best processes for internal coordination?

The communications strategy should focus on strengthening internal communications among government agencies and identifying non-governmental allies with whom the local authorities need to engage. The strategy also considers the types of behavioural changes required by stakeholders along with the messages that might trigger change.

To bring about behaviour change in environmental practices, the strategy should:

- Build broad-based public awareness and increase it in all aspects of the city policies and the SEACAPs while promoting its actions.
- Raise the profile of the cities' SEACAPs regionally and internationally, particularly among policymakers and donors.
- Spread awareness about understanding the impact of climate change.
- Target different groups and cover several environmental sectors.
- Elaborate on a communication strategy and methodology tailoring strong key messages to each target group.
- Inform, inspire, and convince the public of the need and benefits for allocating resources in climate change adaptation (sooner rather than later) from public and private investments to get more significant support.
- Support civil action to educate and mobilise citizens on climate change by providing them with tools, resources, and opportunities.

The strategy can also draw on the wide range of experiences and best practices other organisations and governments have had in conducting outreach in the areas of environment, climate, and clean energy as well as take inspiration from regional and international experiences. Countries and cities worldwide are integrating strategic communications into their climate change plans, providing a wealth of best practices from which to draw.

Section III addresses steps for communications and awareness campaigns.

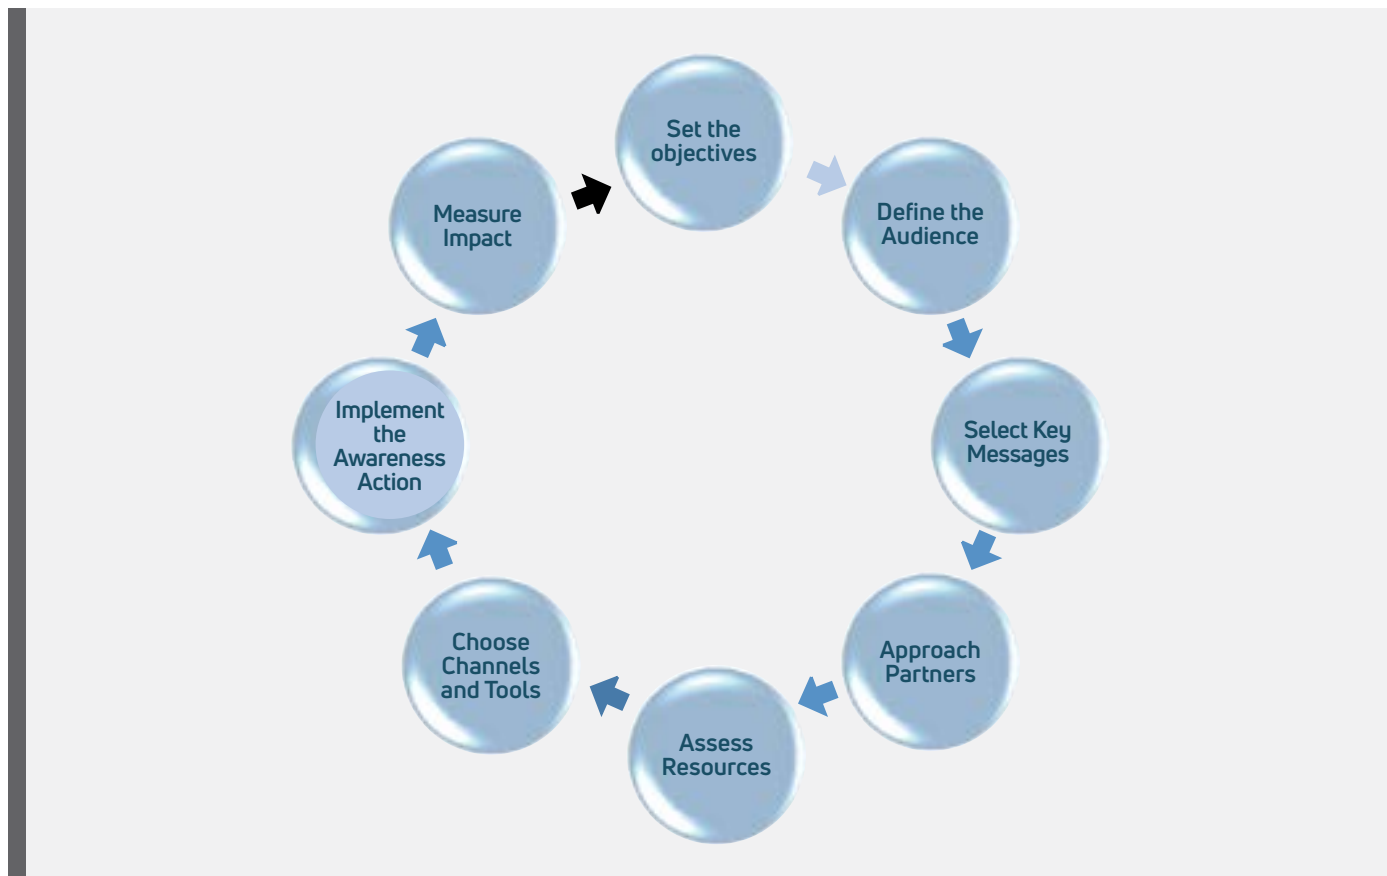

Step 6: Assess sustainability

Sustainability is a significant challenge for CAP and outreach campaigns. Funding, mobilisation, and collaborative partnerships secured during an awareness campaign must be maintained over the long term. The effectiveness of awareness-raising activities and the overall communication strategy needs to be assessed through formal surveys or informal means that will lead the communication team to revise its original strategy and plans if necessary. Monitoring feedback from the field and implementing the activities can contribute to the CAP's overall success.

III- Designing and implementing the communication and awareness campaign

- A- Set the main communication objectives
- B- Identify key audiences, both internally and externally
- C- Develop key messages
- D- Approach potential partners
- E- Assess and strengthen your resources
- F- Select the most effective and available communication tools, modes, methods, and channels
- G- Implement the awareness campaign
- H- Evaluate, amend, and monitor the impacts and results of the communication campaign\

Figure 7: The eight key components of a communications strategy

Effective communication is essential to a municipal plan or project, both internally among different departments of the local authorities, associated public authorities, and all those involved as well as externally with relevant stakeholders including citizens, associations, and NGOs. It should be driven from the bottom up and involve a broad community group.

From the very beginning, a carefully designed communication/outreach strategy should be integrated into the SEACAPs. This will ensure that its objectives and implementation will align with the Action Plan and its supporting activities.

This section guides local authorities in designing and implementing a well-conceived and impactful communication and awareness-raising campaign by setting the objectives; identifying key target audiences and potential partners; defining key messages; selecting the most effective modes, methods and channels; creating a realistic action plan, timing, and deadlines for each activity stage; planning the resources and the budget; evaluating the campaign's impacts; monitoring results; and amending as necessary.

The strategy should also draw on previous and current communications activities, and establishing an internal communication department within the municipality may be crucial too.

A- Set the main communication objectives

Setting objectives are the key to the success of the communications strategy.

Ensure communication objectives are "**SMART**": **Specific** (what, why, who, where), **Measurable** (how much and how many), **Achievable** (how realistic is it), **Relevant** (is it applicable), and **Time-bound** (when).

The strategy can be designed to meet one or more clear, measurable, and specific objectives, such as:

- Build broad-based public awareness of the city's climate change policies and frameworks.
- Plan a course of action providing specific public information on all aspects of the SEACAPs, promote its priority actions addressing climate change and communicate the new vision of the city.
- Raise the profile of the cities' SEACAPs regionally and internationally, particularly among policymakers and donors.
- Encourage a municipality-driven approach to adapt to climate change so that the target population and other stakeholders act in concert and speak with one voice, and actively contribute in a collaborative effort to develop and implement climate change policies.
- Raise the EU profile and actions in the South Neighbourhood and internationally.
- Help build and solidify partnerships with key actors between governments and civil society including local communities, women's groups, and the private sector.
- Promote regional coordination with other local/national authorities and stakeholders.
- Provide general information to the community of the opportunities and threats brought about by climate change and raise the level of awareness about its impact and risks to the public.
- Support civil action to educate and mobilise citizens on climate change by demonstrating the practical steps they can take while empowering them with tools, resources, and opportunities. Provide advice and examples of best practices for communicating adaptation to climate change and mitigation through reducing emissions.
- Build on the work on awareness-raising actions previously implemented.
- Link awareness activities to other capacity-development activities.

B- Identify key audiences, both internally and externally

Climate change should concern everybody, but in truth, some people will feel more concerned than others because they face specific risks or because they can play a particular role in solving problems.

- Consider the benefits of identifying the possible target audience's primary groups (and sub-groups), including policymakers, community leaders, business and industry leaders, farmers, technical experts, youth, religious leaders, citizens at large, opinion shapers, women, academia, funding institutions, and the media.
- Identify the profile of the audience (primary and secondary target groups) based on relevant data such as age, social, and economic status, education level, current behaviour, level of environmental awareness and knowledge, preferred methods for receiving information, motivation/barriers to hearing and accepting the information.
- Assess their knowledge, attitudes, behaviours, and interest focusing on the needs of your target audience: Why should they care about climate change? What is it in for them? The profile of each potential target group can be assessed through formal surveys or informal conversations with small but representative samples of individuals. (See the survey questionnaire in Annex 2).
- Aggregate information and resources responding to specific situations and their communication goals, the audience, the subject matter, and the available media.

As climate change is a global problem with wide-ranging impacts, the climate change messages must be communicated successfully with many different groups, including residents, partners, opinion formers, and stakeholders.

Do not overlook the importance of engaging youth in long-term campaigns against climate change. Schools and local organisations such as the Scouts can offer useful channels for reaching young people. Teaching kids at a very early age how to respect and protect their environment will preserve their future as adults, plus they will also encourage their elders and relatives to apply it too.

Religious groups are also important as their views often shape attitudes toward the natural world.

Partnerships with key actors are often necessary to develop and successfully implement a SEACAP project. Together with specialised groups such as NGOs, media, academia, and businesses, the general public is also a priority. NGOs, media, and journalists can prove to be valuable partners in promoting climate change awareness because of their extensive outreach networks. Industries should be involved as key partners because of their contribution to emissions and their potential contribution to effective responses.

C- Develop key messages

Effective messaging passed through an awareness campaign is the foundation of any well-built campaign. When elaborating a message, make sure to keep it as simple as possible, easy to understand in the local language, adequate and attractive to the target group, and inspiring.

Consider what your different audiences care about and the messaging that will help reach them and develop messages designed for each specific target. By tailoring to each audience, you get their engagement and break the barriers

preventing them from responding as you wish. Remember, people should be able to recognise their own values, interests, aspirations, and benefits in the messages they receive.

The effectiveness of an information campaign relies mainly on the effectiveness of the delivered messages.

- With an uninformed public, communication focusing on raising basic awareness on climate change, the messages should recommend simple actions the audience can take to reduce emissions or reduce risks. Messages with a strong sense a social norm supports action can be more effective in encouraging the adoption of new behaviours.
- With an audience already motivated to change behaviour, the most appropriate messages may focus on providing practical or logistical information.

Messages with a strong sense a social norm supports action can be more effective in encouraging the adoption of new behaviours.

- With an audience already motivated to change behaviour, the most appropriate messages may focus on providing practical or logistical information.
- With an audience already taking action, it may be helpful to provide encouragement and guidance on how to overcome perceived obstacles. A target audience successfully involved in the new behaviours may benefit from reinforcement and reminders on the benefits of sustaining the behaviour.

The most effective public outreach campaigns tend to establish a "human face" for an issue. When building the narrative, four main aspects need to be considered:

Emotions and rational arguments: Emotions are a very appropriate way to raise awareness. Once the target group is aware of the problem and its own role, it makes sense to provide rational arguments supporting a change of behaviour. Citizens will be able to link their issues directly to their day-to-day concerns and, in particular, to how they manage their lives. This can help motivate and empower people to act themselves.

Tone: pessimistic and catastrophic messages do not necessarily translate into positive behavioural changes. Messages need to be tailored, positive, and must engage the audience based on cooperation and self-responsibility. Positive messages providing solutions can be more effective than negative messages simply sounding the alarm bell without giving information on what people can do to contribute.

Feasibility: This may be the most important aspect to be addressed to ensure the effectiveness of measures. Citizens need to be informed and motivated, but they need to be able to adopt the measures. The role of the authorities is to provide opportunities for feasible actions. Outreach messages can also encourage support for specific projects or public expenditures.

Repeated messages: The issue of climate change has gained prominence with increasing repetitive media coverage and has helped raise awareness of local and global environmental issues, generating climate actions worldwide. People are preoccupied primarily with their daily issues (economic, internal crisis, health, etc.) To overcome this, motivation, recognition, promotion, and constant dialogue must become familiar tools used whenever you try to convince people to change their behaviours in ways that will mobilise them and change their attitudes. Repetition of the messages is recommended as it generates constant exposure and keeps them in the target group's minds, and this favours success.

Types of messages that may be appropriate in a climate change campaign targeting the general public or key stakeholders:

- Even minor changes in personal and consumer habits reduce emissions and promote adaptation to climate impacts.
- Using public transport and turning off electrical appliances when not in use reduces greenhouse gas emissions.
- As farms are highly vulnerable to a potentially drier and hotter climate, agricultural policymakers and farmers should incorporate climate change concerns into their strategic planning.
- Energy efficiency and renewable energy sources reduce air pollution and improve industrial efficiency, thereby reducing both health problems and business/household costs.
- At work, energy awareness leads to cost savings, higher profit margins, and increased job security.

Base the messages on the "Four E's" approach:

 **Encourage:** offer benefits/praise. Empower stakeholders with knowledge, skills, and open fresh ideas in the process.

 **Enable:** the first step to change should be easy. Emphasise short-term gains as well as long-term benefits.

 **Engage:** involve in the whole community, use the schools and academia, and involve young people and women.

 **Exemplify:** utilise community leaders to set by example, to discuss their approaches; chose a likable, and inspirational messenger that people relate to.

D- Approach potential partners

NGOs, academics, public personalities, and journalists concerned about climate change are potential partners for climate change outreach. They can often reach out effectively and serve as powerful champions and ambassadors of the climate issue. They may also have networks, skills, resources, or credibility to contribute to the outreach campaign. Non-governmental organisations tend to benefit from being flexible, cost-effective, very helpful in identifying participants, and are highly motivated. For example, establishing a Climate Change Committee drawing together local NGOs and associations and engaging the entire local citizens more fully in the issue of climate change can help to develop and support outreach activities.

Institutions, civil society representatives, businesses, and the media, in general, are all positioned to draw society's attention to issues of public concern.¹⁶ This makes them "mediators" whose operating principles, status, and objectives must be clearly identified. Social groups that may already exist (e.g., schools, communities) and established networks are vital for awareness-raising and initiatives as well.

Similarly, businesses can encourage responsible behaviour by consumers, forge partnerships with the stakeholders, and/or provide accurate quantitative information on consumption practices (e.g., energy, green products).

Lastly, media (in general) and journalists (in particular) can make decisive contributions to public awareness-raising and act as opinion formers. You can use them to lobby, convey your message, and run your campaign. Workshops, conferences, and trainings provide opportunities to continue to build new relationships with the media and invite them to deliver articles and capitalise on climate change messages. However, many journalists are unfamiliar with climate issues, therefore it is essential to appoint a credible and recognised voice on climate change.

A potential drawback to working with partners may be a lack of control over the message and how it is delivered. When choosing a partner, it is essential to consider its particular interest in the issue and its knowledge, credibility, reputation, and image.

E- Assess and strengthen your resources.

Early consideration should be given to the budget and staffing available for the awareness campaign. Establishing an internal communication department with assigned responsibilities may be crucial to facilitate collaboration between the services and stakeholders involved.

It is worth considering the benefits of providing training in communications skills to key staff early in the process or bringing in specialists where necessary.

Estimate the time and money involved in your awareness campaign. It is recommended 5% of the total funded research budget be allocated for communication. Ensure good value by targeting communication effectively through prioritising the audiences and channels while focusing on high impact/low-cost activities.

In addition to budget and staff, other resources should be considered such as equipment, contact lists, and other databases. Communication budget and staff resources are usually limited, so the communication effort should be adjusted to focus more intensely on one or two key goals rather than spreading them around. Other ways to leverage limited resources could be partnering with other stakeholders (NGOs, local associations) and emphasizing synergies with other initiatives, projects, or themes. For example, tapping into local or international resources including expertise, copyright-free materials, and funding opportunities, can also be valuable.

F- Select the most effective and available communication tools, modes, methods, and channels

Start considering the best way to transmit your message. One of the most important factors to be considered in the planning phase is selecting the communication channel and tool. This is based on cost-efficiency, media coverage and access, cultural factors, long-term view, and repetition.

You must make sure citizens have an adequate opportunity to learn about projects affecting their lives through the choice of communication tools. To engage the citizens' interest, think about the actual and preferred channels your target audiences might use and whether you plan to use the right ones for maximum impact. It is crucial to specify the most appropriate communication channels (i.e., the most accessible and the easiest to implement and finance) for each target group. Moreover, you should also attract media attention.

There are several communication and dissemination tools available for implementing selected communication and awareness activities related to selected SEACAP actions such as: Face-to-face, networking, advertising, mail, email, internet and social media, blogs, talks/meetings, films, brochures, posters, newsletters, printed publications, media releases, newspapers articles, public relation, sponsorship, broadcast media (TV/radio spots), educational material, high impact events, factsheets, promotional material, contests, as well as organising capacity-building workshops, competitions, etc.

¹⁶ P. Favre 1992

Digital social platforms enable users to exchange information and allow people to network. Their unique feature is the systematic collection and analysis of data and its associated network effects which facilitates exchanges between several groups, creates an exchange of experiences, information and ideas, creates a network community, and promotes cooperation between users.

However, pure information doesn't necessarily result in behavioural changes. Allowing people to reproduce a new behaviour, information materials must be accompanied by actions and events such as exhibitions, public meetings, demonstrations, site visits, citizen juries, public meetings, teleconferences, surveys and questionnaires, media events and press conferences, social events (like screenings, concerts, plays, etc.), discussion groups, forums, open houses, etc.

Public awareness aims at early results and is often pursued via the media and outreach campaigns as communicating with the public, and engaging stakeholders is very important. It should be coupled with education programmes to get to more profound, long-term change in habits, particularly among the young. These programmes tend to use

formal methods and settings to transmit a more substantial understanding of the climate change problem and its potential solutions and scientific, technical, and municipal personnel training. Widespread involvement in shaping policy and implementing climate change programmes can contribute enormously to effective action.

Driving factors include those that tap into existing social networks and provide social support. Campaigns that focus on the needs and address the community as a whole are better received and provide more incentives and influence. Empower stakeholders with knowledge, skills, and confidence in the new practice, have the tools to help, and ensure the technology aligns with their views and interests.

Exploit seasonality to maximum benefit: Climate change issues are most likely to be raised in people's minds at times of extreme weather, winter storms, floods, summer droughts, water shortages, hurricanes, heat waves, etc.

G- Implement the awareness campaign

Once the tools are selected, and the planning above is done, you may start designing and implementing the awareness campaign. This is where we go into more specificity in the objectives, detailed target, messages, content, etc.

Implementation requires coordination among all actors and open channels of communication with non-government stakeholders in civil society and the private sector. In many cases, successful implementation will also entail persuading stakeholders of the benefits from early action.

Awareness campaigns must be simple and emotional and use understandable language for most people as they have an essential role to play in achieving significant change across cities in the pursuit of change. They should have their own identity, tone of voice, and creative look and feel.

Key aspects of a campaign require a series of tactical concepts when designing them:

- Create a common visual campaign identity by designing a logo that will be a visual representation of your campaign and communicates your values and principles. The logo will be used through all your communication channels as well as promotional materials and as a symbol, will create consistency and make people recognise and remember your campaign quickly.
- Develop a creative theme or 'big idea' that will capture your audience's attention and encourage engagement.
- Engage audiences with graphically appealing campaigns using real photos with real people. Stand out with eye-catching infographics bringing data to life, clean and airy designs, and easy to read fonts.
- Make your content coherent and consistent- repeat structures, colours, and the images and infographics style. Well organised content keeps the reader's attention and makes the content more attractive and readable.

Every city has its own issues, culture, and priorities; thus it is important to reflect these in your communications.

- Images work, so visualise your message with a graphic, an icon, or a photographic image summing up your campaign.
- Use testimonials or human-interest personal stories to add depth from real people, ambassadors, and heroes. That will give people a voice.
- Make it a positive light and feel-good campaign by adding humour and using illustrations.
- Tap into data if you have got some big numbers or killer facts you can use to captivate people.

- Build an interactive space where your audience can share their views and give the campaign a human dimension.
- Make it visually attractive with a catchy slogan.

If you're hosting an event, this involves excellent planning, management, and evaluation. To make it successful, choose an appealing event name, a concept, a slogan, or a hashtag that fits your broader awareness campaign and messaging and connects with your overall campaign look and feel.

You may choose to go for large events which are an opportunity to reach a bigger audience, create impact, attract media and raise visibility, present a wide range of topics, and invite renowned experts worldwide. Smaller events are more effective in bringing people closer, and creating bonds.

Don't forget to promote your event, send formal invitations, and "save the date" notes and other reminders.

H- Evaluate, amend, and monitor the impacts & results of the communication campaign

Since successful communication is about sharing the correct information, at the right time, with the right audience, evaluating the effectiveness and the impact of a communication campaign on public perception is well worth the effort.

Once the message has been communicated to the audience after a campaign phase, monitoring and evaluating the communication and awareness actions is the next step. It entails sharing quantitative and qualitative information about how activities are performing and the impact they have produced. It also investigates increased awareness, increased pride, and willingness to get involved and ensures the lessons drawn from that analysis reach the right people at the right time.

The key questions to be asked are: Has the message been heard/understood/pursued? Credible feedback on these questions from the target audience can be obtained through follow-up interviews or surveys and close observation of behaviour changes. Such monitoring and feedback about how communication and awareness actions are performing helps evaluate how the strategy is being implemented and adapt a campaign as you go along, improving it for next time, and justifying future budgets.

The qualitative evaluation is very useful and needs to be made at three levels:

- **Increased awareness:** Polling stakeholders before, during, and after a campaign assesses the shift in awareness over time. For example, if launching an awareness campaign in the local area to help residents understand the value of the biosphere reserve, conducting a street poll with a sample of residents that includes questions on their level of understanding of what a biosphere reserve is would indicate the change in the level of awareness.
- **Increased pride:** Asking questions about what they value most about the local area and how they feel about living there, points towards their feeling of belonging and their level of satisfaction.
- **Increased willingness to get involved:** Asking stakeholders how likely they are to want to get involved or what more they might need to participate are good ways to gauge their willingness to participate.

The quantitative evaluation should measure:

- **Reach:** Determines the number of people directly targeted by your communication and the number of people indirectly contacted by your communications.
- **Impact:** Assesses the increase in awareness and changes in the behaviour and the increased willingness of people to get involved in the action.
- **Investment:** Accounts for the funds provided for the awareness activity

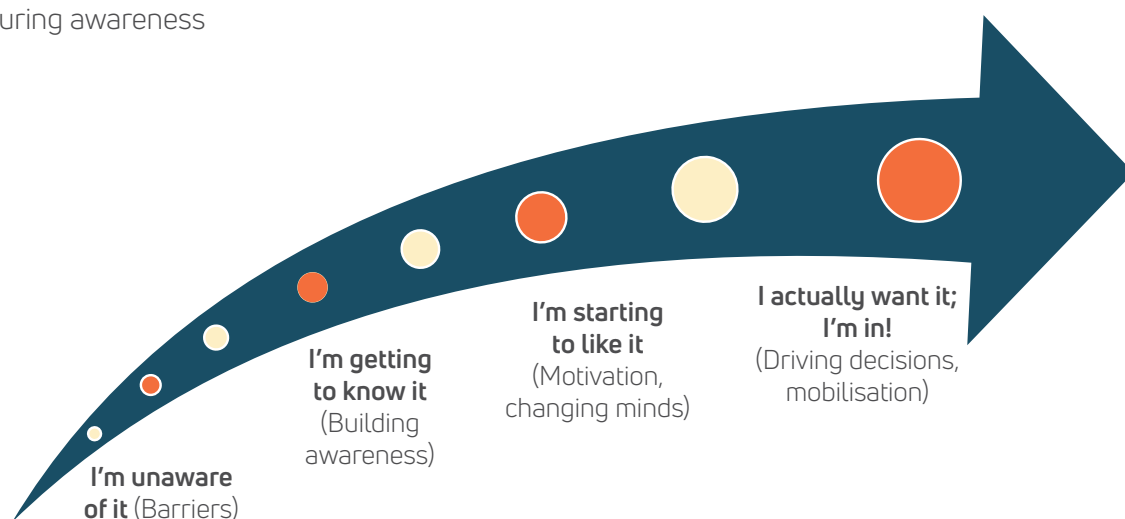

The monitoring and evaluation step must be integrated into the planning phase, especially when adapting or modifying human behaviour. Evaluating the effectiveness of the communication and awareness action requires choosing an evaluation method. There might not be harmonised worldwide methods for comparing behavioural measures, so the current challenge is to find better ways to evaluate measures effectiveness and establish indicators such

as a headcount at a seminar, quantitative/qualitative surveys, video views on YouTube, hits on the website, social media interactions, feedback via e-mails, press clippings, etc. This will:

- Evaluate the impacts of the communication.
- Measure if higher awareness is translated into more energy-efficient/environmentally friendly individual behaviours.
- Collect the data.
- Conduct the evaluation, report results, and disseminate the results to improve the effectiveness of future programs.

Figure 8: Awareness Process: Building Levels Of Awareness Leading To A Change In Attitude

● Measuring awareness

Overall recommendations and best practices

There is still a lack of knowledge among end-consumers about how the information is provided. It might be deduced that previous approaches such as the price-based approach (save money) and the environmental approach (save the planet) were not completely successful. People need to be inspired, engaged, and have fun when receiving the message.

Repeated exposure to the message is especially important and favours simultaneous reception from multiple sources. Repetition or further development of the campaign is recommended to keep the message in the target group's minds.

Set up internal communication to improve collaboration among all municipal departments.

Establishing an internal communication department responsible within the local authority may be crucial for facilitating and improving collaboration between the services and stakeholders involved.

Adhering to the Covenant of Mayors for the Mediterranean (CoM-Med), and building a regional network with other local authorities, especially CoM signatories, allows sharing experiences and best practices. It is highly recommended as it accelerates learning and highlights the actions taken by each local authority which may also attract investors and additional funding to support pilot and demonstration projects.

Develop a better understanding of consumer behaviour across genders, integrating lessons learned from behavioural insights and an up-to-date survey on gender differences in consumer attitudes to sustainability and their drivers. Men and women express different preferences, perceptions, and beliefs when acting in environmentally friendly ways. Mainstreaming gender equality in environmental strategies/policies is therefore crucial in advancing towards a fairer and more sustainable form of development.¹

Encouraging individual actions, citizen initiatives, and volunteering; facilitating more affective and experiential engagement (personal stories) are also helpful.

Turning principles into practice requires communication and mediation efforts driven by public authorities: informing, raising awareness, influencing perceptions and behaviour, and relaying and legitimising the implementation of public policies are all among the objectives for the communication efforts of institutional actors.²

¹Gender and the Environment; Building Evidence and Policies to Achieve the SDGs

²R. Debray 1993; C. Ollivier-Yaniv 2000

Taking into account

Consumption and behaviour patterns can be heavily influenced via effective public communications campaigns. Building on behavioural insights can support consumers in reaching more sustainable consumption choices by adapting messages across different social groups. Media and citizen engagement can play a significant role in changing unsustainable consumption patterns and transitioning towards a sustainable economy.

Targeting gender roles and behavioural preferences in climate actions is recognising that women's exposure to environmental stress factors need to be considered in this effort.^[1]

Facilitate ongoing communication between the city and the citizens and carrying out a public consultation to ensure they learn about projects affecting their lives and assure their involvement and engagement.

Scientific information is critical to telling the climate change story, but it needs to be translated in an accessible or entertaining way for the general non-scientist public.

Dramatic visual portrayals of climate change are persuasive, even in animated form. However, it is not necessary to emphasise fear to create urgency and response.

Avoid duplication of actions. If there are parallel initiatives already in process, it will be efficient to collaborate in a joint, unified effort.

Awareness-raising takes time. All of the most successful public awareness campaigns are sustained consistently over a number of years. During the process, the positive message needs to be constantly reinforced.

ANNEX 1

The Vision of Your City / What You Want to Achieve

The vision for your city is based on what you see today and what you hope for tomorrow.

Creating your city's vision defines the city's desired future, a vision of "A Community for a Lifetime" – a great place to live, learn, work, and play, a "city with a sustainable future," etc.

- A vision is a broad statement of the desired outcome for a target community or audience.
- A vision should be:
 - Specific enough to describe what life might be like if the vision were implemented and guide goal-setting activities.
 - Broad enough to encompass many goals and implementation strategies.
 - Ambitious enough to articulate a measurable Action Plan.
- It includes themes like sustainable development, healthy communities, and quality of life.
- It is one of the required ingredients in realising a comprehensive SEACAP and making it succeed together with leadership, action, and partnerships.
- It is one of the key elements in articulating the communication plan.

The Importance of a City's Vision

For a city to develop a strong magnetic pull, its leaders need to:

- Make conscious decisions together with its city council about WHAT they want to become as a community.
- Establish the priorities that need to be addressed.
- Shape the vision for the future and set the direction to develop achievable strategies and plans

Creating the Vision

Ask yourselves and the community a real question as to whether anyone would want to live in such a place as your city, whether it is a place to "be in".

Look further ahead, imagining what your city will look like decades from now.

My city will be a city of...

- Conservation and use of our natural resources and environment
- Active citizens and business partnering with city government
- Mobility for citizens, businesses, tourists by coordinating alternative transport
- Safety for our people
- Health with a focus on the well-being of people and our environment

The Vision of your "city of tomorrow" should be structured around storytelling with a slogan. It all depends on the world you want to centre the story around. If you have a story that centres on climate change, you need to imagine and remake your city in that image.

An Example from Jordan's Aqaba Special Economic Zone Authority (ASEZA)

The slogan: "Go green – The future of Aqaba city"

Aqaba is a rapidly growing city that has almost doubled its population within a decade. This trend is expected to continue though at a lower rate. This population increase poses significant pressures on the existing and future infrastructure and the city's further development. The ASEZA is deeply committed to a sustainable future for the city.

The storytelling: Its vision expressed through the actions selected in its SECAP focuses not only on reducing energy consumption through energy efficiency or producing more clean energy, but also on "greening" the existing as well as future infrastructure at the municipal level.

The image Aqaba projects are strikingly clear in showing a perspective of what a green city will look like.

A) Guiding principles when setting up the vision of the city

- Always maintain a **long-term view**.
- **Put people and community well-being at the centre of the vision:** engage, inform, and create opportunities for people to participate in achieving a shared vision.
Citizens also play a role in establishing the direction of the city and creating a compelling vision for the community. Listen to what people have to say to develop a shared project vision. Think of young wealth creators and becoming highly attractive to educated, ambitious young people.
- Keep in mind **places, heritage, culture, environment:** celebrate and share the great features in the city that mean the most to its citizens.
- Think about **prosperity, economic development, transportation, and infrastructure:** encourage the growth of the local economy where there is an opportunity for everyone to contribute and succeed.
- Connect to **other cities**.
- Cultivate **new and innovative ideas**.

It is easy to focus on short-term gains and lose sight of the potential to make long-term changes. A good city manager stays in the post for only a few years, but they can affect the lives of citizens for much longer. A thriving city is one that goes further and creates a sense of belonging and purpose.

B) Where to start

A city should identify the needs to shape its vision, recognise the opportunities to answer the needs and determine the priorities leading to actions.

An Example from Lebanon's Kab Elias-Wadi El Delm A Sustainable Pilot City

Needs: With 75,000 people in 2013 producing 19,162 tons of municipal solid waste (MSW) per year, the MSW in Kab Elias is collected and transported by municipality trucks and then manually sorted in the landfill. The unsorted wastes are disposed of in an unsanitary waste landfill.

Opportunities: Changing behaviour in solid waste management and transitioning to a smart way to sort solid waste at the source.

Recommendations: Ensuring capacity development and enhancing public awareness; enhancing plans for sorting solid waste at the source; developing a waste strategy plan with a waste management plan to overcome the high cost in collection and transportation and look for a solution to the landfill either by converting it to a sanitary landfill or utilising another one near the city; and implementing waste power generation from solid waste to feed energy to a future solid waste plant.

C) Planning requirements for your city

One of the most important actions any organisation can take is to focus on what they want to be and how they will get there. With this in mind, the city council will place considerable time and effort into adopting a mission statement, vision statement, values statement, and strategic goals for the city.

Vision

Define the City's identity:

The city should promote the uniqueness of its founding communities, heritage, rivers, environment, cultures, and common future. It should be clear that a city's identity reflects its residents' values, interests, and skills.

Looking into the future:

A city should own its identity and celebrate it.

A city can refine, re-establish, or entirely reinvent what a city is known for. A totally new identity can be established for a city if its old identity is lost.

Develop a vision statement (slogan):

The slogan is a mental picture of the city's possible or desirable future state.

Example:

The City of X will become a vibrant community focused on a booming town centre while preserving its natural character and agricultural roots.

Mission

The city's mission is an important statement describing why the city staff, council, and members exist as an organisation. **A mission statement** is the purpose or role of the organisation describing the organisation's reason for its existence (working together, serving our community...)

"As the world moves toward a focus on a Sustainable Pilot City and a low-carbon approach to meet the growing energy requirements, Kab Elias-Wadi El Delm is taking action to create a conservative culture and ensure a sustainable economic future and clean environment. (...) Kab Elias-Wadi El Delm is looking forward to building a future where it can be confident that the decisions taken today ensure its citizens grow up in an environment that is productive and protected by all."

Core Values

A city's values enable the development of its vision. The city has to commit to its core values (i.e., ethics and integrity, open and honest communication, respect of the citizen, professionalism...); These values will set the example and play an essential role in the decisions and actions of the city. (For example, if sustainability is one of the city's core values, we need to have all municipal employees think and act in such a manner.)

Sometimes a values statement describing those values is necessary to fulfilling the city's mission.

Strategic Plan & Goals

Developing long-term strategies and initiatives to achieve the vision should include broad public involvement, community consultation, and engagement of the community members on issues affecting it.

The strategic plan represents a base for decision making, connects the community's vision and goals with the corporate mission, values, and actions of the city, allows debates and fosters collective responsibility. The Strategic Plan can be developed in three phases:

- Phase 1: Reach out to the community and hear from them about what should be focused on to make life in it better (could be done online or during consultations).
- Phase 2: Get a summary of community feedback and next steps on the categories for developing the strategic plan (heritage & architecture, environment, transportation, infrastructure...)
- Phase 3: Drafting recommendations, goals, and objectives of each main point; the process of implementation, financial impacts...

"Sometimes, the people who make a lot of noise against something drown out the larger number of people who support an idea and recognise the long-term benefit to the city. True leadership is about being prepared to work to achieve that long-term dividend and remembering that a resilient city is one that plans for the future."

George Ferguson, Mayor of Bristol

ANNEX 2

SURVEY QUESTIONNAIRE FOR CONDUCTING A LOCAL NEEDS ASSESSMENT

An awareness campaign is likely to succeed if we address the right messages to the right stakeholders and have them play a key role in its implementation.

The following survey questionnaire will help identify the possible audiences in your city, assess their level of awareness, knowledge, attitudes, interests, and behaviour, plus explore climate change priorities, existing resources for communicators, barriers to action, etc.

According to the findings, the information revealed in the survey will help you design audience-specific messages and build your awareness and communication campaign.

The survey can be carried out through in-person and informal telephone conversations or a formal written questionnaire with small but representative samples of people. Moreover, you may enhance it with additional questions related to further investigations and goals.

GENERAL ENVIRONMENTAL CONCERNS

What is your level of agreement with the following regarding global warming/climate change?				
	Completely agree	Not fully agree	Completely disagree	Don't know
It is a real threat to the population around the world.				
It is a serious threat to you and your family				
It is caused by human activities				
Its impacts are underestimated in the news				
The government should increase the incentives for people who try to reduce climate change				
I am ready to reduce my energy usage to tackle climate change				
The global temperatures have changed compared to the previous decade				
Climate change is happening right now				

In your opinion, how important do you think the following issues are on a global scale?

	Very Important	Important	Slightly Important	Don't know
Air pollution				
Pollution of rivers and seas				
Flooding				
Litter				
Poor waste management (e.g., overuse of landfills)				
Traffic/congestion				
Temperature rise or drop				
Hole in the ozone layer				
Using up the earth's resources				
Radioactive waste				

Do you think that climate change is caused by natural processes, human activity, or both?

	Yes	No
By natural processes		
By human activity		
Equally by both		
Climate change is not happening		
Don't know		

Which strategies reduce greenhouse gas emissions?

	Yes	No
Turning off lights when leaving a room		
Walking or riding a bicycle instead of driving short distances		
Turning down the thermostat by at least 1°C.		
Using energy-saving lights		
Turning off stand-by switches on appliances		
Taking shorter showers		

GLOBAL ENVIRONMENTAL ISSUES

Which alternative energy sources do you think will be the most important in [city]?

Wind	
Solar	
Nuclear	
Natural gas	
Coal	
Other	

How worried are you that energy may be too expensive for many people in [city]?

Very worried	
Somewhat worried	
Not at all worried	
Don't know	

Regarding the environment, would you say:

	Environmental issues don't interest me
	Environmental issues are interesting to me, but the subject is complex, and I don't understand or master it
	Environmental issues worry me, I think about them, but I don't know what to do
	Environmental issues worry me, I think about them, and I am careful in my behaviour
	Environmental issues are a challenge to me, I think about them, I am committed and mobilized within associations

GENERAL VIEWS ABOUT THE ENVIRONMENT

How concerned are you about air pollution?

Very concerned	
Slightly concerned	
Not at all concerned	

How concerned are you about the extinction of endangered species?

Very concerned	
Slightly concerned	
Not at all concerned	

How willing are you to change your lifestyle to reduce environmental damage?

Very willing	
Not so willing	
Not willing at all	
Don't know	

What actions do you implement in your mobility choices?

	I try to reduce the usage of my car
	I prefer public transport for my daily journeys
	I do car sharing
	Other

How often do you recycle?

Always	
Most of the time	
Occasionally	
Never	

PERSONAL AWARENESS

Do you tend to buy the most energy-efficient home appliances?

Most of them	
Some of them	
Not at all	

Do you think that limiting your own energy use would help reduce climate change?

Very likely	
Not at all	
Don't know	

In your daily life, how often do you do things to reduce your energy use?

Always	
Very often	
Sometimes	
Never	
Cannot reduce	
Don't know	

In your residential choice, do you consider the following items as important?

	Very important	Important	Not very important	Unimportant	Don't know
Energy-saving housing					
Technology for tracking energy consumption					
Low carbon heating system production					
Energy production system (i.e., PV)					
Smart and recycling system for water management					

In your residential choice, do you consider the following items as important?

	Very important	Important	Not very important	Unimportant	Don't know
Presence of a green space (e.g., garden)					
Shared green space					
Presence of green walls					
Ecological maintenance of natural areas					
Facilities for fauna and flora (e.g., beehives)					

Are you aware of the global policies or initiatives taken by various organisations to reduce climate change/global warming?

Yes	No
-----	----

Are you aware of the environmental policies in your country/city?

Yes	No
-----	----

ABOUT YOU

Tell us more about yourself.

Gender	
Age group	
Education level	
With/without children	
Occupation/profession

'This publication was produced with the financial support of the European Union. Its contents are the sole responsibility of the Clima-Med project and do not necessarily reflect the views of the European Union.

Each SEACAP has been developed jointly by members of the Idhna technical staff and the Clima-Med team of experts led by Naguib Amin (Team Leader). Core members are Ossama Kassamani (Key Expert, Local Sustainable Development specialist), Walid Abu Al Halaweh (Clima-Med Policy & SEACAP Action Coordinator, Palestine), Alexandra Papadopoulou (Climate and Sustainable Energy Expert), Myriam Makdissi (Key Expert, Communication and Networking). Other contributors include Simon El Hachem (SEACAP Preparation Expert), Paul Tabet (Junior Expert, SEACAP preparation), Rania Kassamani (Junior Expert, SEACAP preparation), and Malek Mardam Bek (Clima-Med Office Manager, Mashreq region).

Clima-Med is an EU-funded project implemented by a DAI led Consortium as part of the activities of the European Union's project for ENP South Countries EUROPEAID / 139067 / DH / SER / MULTI.

Nadya Boneva is Clima-Med Project Director (DAI Practice Leader: Planet).
